Acta Crystallographica Section E: Structure Reports Online is the IUCr's highly popular open-access structural journal. It provides a simple and easily accessible publication mechanism for the growing number of inorganic, metal-organic and organic crystal structure determinations. The electronic submission, validation, refereeing and publication facilities of the journal ensure very rapid and high-quality publication, whilst key indicators and validation reports provide measures of structural reliability. In 2007, the journal published over 5000 structures. The average publication time is less than one month.

Received 8 February 2008; accepted 29 February 2008

Key indicators: single-crystal X-ray study; $T = 297$ K; mean $\sigma(\text{O}-\text{B}) = 0.010$ Å; R factor = 0.037; wR factor = 0.091; data-to-parameter ratio = 13.3.

The title compound, $\text{Rb}_2\text{Ga}_2\text{O}(\text{BO}_3)_2$, is part of the homologous series $A_2\text{Ga}_2\text{O}(\text{BO}_3)_2$ ($A = \text{Na}, \text{K}, \text{Rb}$ and Cs). The structure contains pairs of gallium-centered tetrahedra connected through a shared oxygen vertex. Orthoborate triangles connect the basal vertices of the tetrahedra, forming a three-dimensional network with voids occupied by rubidium ions.

Dirubidium digallium oxide bis(orthoborate)

R. W. Smith, C. Hu and C. D. DeSpain

Comment

Complex metal borates adopt various structure types that result from the many possible geometric arrangements formed by metal-centered polyhedra and borate anions, which can be either three- or four-coordinate. They are also of interest as nonlinear optical materials, such as β -BaB₂O₄, LiB₃O₅, and YAl₃(BO₃)₄ (Chen *et al.*, 2004). For these reasons, we have examined the phase diagrams of alkali metal gallium borates and have determined the crystal structures of some of the materials discovered. The homologous series A₂Ga₂O(BO₃)₂ (A = Na, K, Rb, Cs) is a portion of the new compounds discovered to date. In each, pairs of gallium-centered tetrahedra are connected through a shared oxygen vertex, and the tetrahedral basal planes are connected through shared oxygen vertices with triangular orthoborate anions. Depending on the size of the alkali metal ions, which occupy channels or spaces within the three-dimensional network, the compounds crystallize in different space groups: *P* $\bar{3}$ 1*c* for the Na member (Corbel & Leblanc, 2000), *P*321 for the K member (Smith *et al.*, 1997), and *P*2₁/*c* for the Cs member (Smith, 1995), which is isotypic with the Rb compound reported herein (Fig. 1).

Experimental

Powders of Rb₂Ga₂O(BO₃)₂ were prepared from stoichiometric mixtures of RbNO₃, Ga(NO₃)₃, and H₃BO₃, which were decomposed in alumina crucibles at 300 °C and then heated to 500 °C at 50 °C increments, with a soak of several hours at each temperature and intermediate grinding between each soak period. Crystals were grown in a platinum dish from a 1:1 molar mixture of the prepared powder in the presence of Rb₃BO₃ flux. The mixture was heated to 700 °C and cooled at 10 °C/hour to room temperature, and a single-crystal was cut from the crystal mass for subsequent X-ray diffraction analysis.

Refinement

The highest peak and the deepest hole are located 0.74 Å and 1.13 Å, respectively, from Rb2.

Figures

Crystal data

$\text{Rb}_2\text{Ga}_2\text{O}(\text{BO}_3)_2$	$F_{000} = 808$
$M_r = 444.00$	$D_x = 3.727 \text{ Mg m}^{-3}$
Monoclinic, $P2_1/c$	Mo $K\alpha$ radiation
Hall symbol: -P 2ybc	$\lambda = 0.71073 \text{ \AA}$
$a = 8.8115 (18) \text{ \AA}$	Cell parameters from 1660 reflections
$b = 7.7224 (16) \text{ \AA}$	$\theta = 3.7\text{--}25.7^\circ$
$c = 11.997 (3) \text{ \AA}$	$\mu = 19.03 \text{ mm}^{-1}$
$\beta = 104.246 (4)^\circ$	$T = 297 (2) \text{ K}$
$V = 791.3 (3) \text{ \AA}^3$	Block, colorless
$Z = 4$	$0.23 \times 0.21 \times 0.19 \text{ mm}$

Data collection

Bruker SMART APEX CCD diffractometer	1568 independent reflections
Radiation source: fine-focus sealed tube	1151 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.093$
$T = 297(2) \text{ K}$	$\theta_{\text{max}} = 26.1^\circ$
ω scans	$\theta_{\text{min}} = 2.4^\circ$
Absorption correction: numerical (SADABS; Sheldrick, 2003)	$h = -10 \rightarrow 10$
$T_{\text{min}} = 0.118$, $T_{\text{max}} = 0.429$	$k = -9 \rightarrow 9$
8611 measured reflections	$l = -14 \rightarrow 14$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.037$	$w = 1/[\sigma^2(F_o^2) + (0.0376P)^2]$
$wR(F^2) = 0.091$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.05$	$(\Delta/\sigma)_{\text{max}} < 0.001$
1568 reflections	$\Delta\rho_{\text{max}} = 1.28 \text{ e \AA}^{-3}$
118 parameters	$\Delta\rho_{\text{min}} = -0.90 \text{ e \AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
