A COMMUNICATION METHODOLOGY FOR
NEGOTIATING A WHEAT CONTRACT WITH CHINA

A Thesis
Presented to Members of
Thesis Committee
Director: Dr. Elton Carter
Committee Members: Dr. Andris Skreija
Dr. Bruce E. Johansen

In Partial Fulfillment
of the Requirements for the Degree
Master of Arts
University of Nebraska at Omaha

by
Mary Alice Speke Ferdig

December, 1985
THESIS ACCEPTANCE

Accepted for the faculty of the Graduate College, University of Nebraska, in partial fulfillment of the requirements for the degree Master of Arts, University of Nebraska at Omaha.

Elton S. Carter
Chairman
22 November 1985
If human beings are by nature civilization-builders, or "time-binders," and if all time-binders, or civilization-builders, are both inheritors from the toil of bygone generations and trustees for the generations to come, then we humans stand in the double relationship—debtors of the dead, trustees of the unborn—thus uniting past, present and future in one living, growing reality.

Chapter I

INTRODUCTION AND DESIGN

Introduction

This study is not a study in cross-cultural communication; nor is it a study of Chinese cultural, socioeconomic, or political factors; nor is it a prescription of communication techniques for the would-be cross-cultural negotiator. Likewise it is not intended to provide advice regarding global economic affairs or international diplomacy. Instead, it is a study in human communication. The result of this study is a communication methodology designed for use by representatives of a United States (hereafter referred to as U.S.) wheat trading company while planning and negotiating any wheat deal with representatives of the People's Republic of China (hereafter referred to as China). This methodology provides a systematic means by which company selected negotiation personnel can generate any combination of communication strategies to meet the needs of the particular negotiation situation.

Genesis of the Study

My interest in managing conflict through the negotiation process began when I served as board member and principal negotiator for a local public school district. I learned to appreciate the "art" of creative negotiation as we faced the challenge of mutually discovering solutions that served to meet (1) the salary/benefit needs of the district educators, (2) the "limited budget" concerns of the local taxpayers, and (3) the educational needs of the children in District 59.
A 1983 visit to the People's Republic of China stimulated a lifelong desire to explore other cultures: to learn about others' customs, and to attempt to discover how others think, feel, and view themselves in relationship with the world.

A close association with a midwestern United States agricultural environment coupled with my interest in cross-cultural conflict management through negotiation has led me to focus on agricultural negotiations between representatives of United States and People's Republic of China. Perhaps a communication methodology with a central focus on managing conflict through negotiation could make a modest contribution to the stabilization of global agricultural trade.

My background as a communication student includes transactional communication with a general semantics orientation, rhetorical theory emphasizing argumentation, and general systems theory. The perspective of this study is a natural outgrowth of these theoretical influences.

Statement of Purpose

The purpose of this study is to design a communication methodology for use by representatives of a U.S. company negotiating a wheat contract with Chinese officials. A methodology is "a philosophical study of plurality of methods... It always has to do with the activity of acquiring knowledge, not with a specific investigation in particular. It is, therefore, a metamethod" (emphasis added; Watzlawick, 1944, p. 8). The concept "managing conflict" refers to preventing or mediating conflict. "Negotiating" is defined by G. I. Nierenberg (1983) as
a process\(^1\) whereby "people exchange ideas with the intention of changing relationships, whenever they confer for agreement. . . . Negotiation depends on communication" (p. 4).

Communication, in turn, depends upon making and sharing choices. A prime function of a communication methodology is to enable users to generate a repertoire of choices from which they may select strategies and tactics according to the particular negotiation situation.

The substance of this methodology is drawn from three bases of study: (1) creative negotiation process as described by G. I. Nierenberg (1971, 1973, 1983); (2) rhetorical argumentation theory grounded in Darnell and Brockriede's (1976) "shared-choice" model (hereafter called choice-sharing model); and (3) intelligence information processing (as associated with military or\(^2\) diplomatic application) by use of heuristic problem-solving guidelines (Oneill, 1964).

The methodology is explained by way of comparative analysis of contrasting approaches—choice-sharing versus choice-restricting—in an extended example of negotiations between representatives of the U.S. and China.

It would be naive to assume that any single method of negotiation is appropriate or effective in every situation. Instead, a methodology (method of methods) is needed. The aim of this thesis is to meet that need by designing a communication methodology for negotiators in an agricultural-trade context.

---

\(^1\)Berlo (1977) reviews the impact of the concept "process" within the context of communication research.

\(^2\)"Or" is used throughout this study in the sense it is used in computer software; meaning A or B, or both.
**General Systems Theory**

Von Bertalanffy, founder of general systems theory, recognized characteristics of dynamic interaction, organization, and wholeness in specialized fields of science including modern physics, biology, and cybernetics.

We can conclude that there are models, principles, and laws that apply to generalized systems or their subclasses, irrespective of their particular kind, the nature of their component elements, or the relations of "forces" between them. It seems legitimate, therefore, to postulate a theory, not of systems of a more or less special kind, but of universal principles applying to systems in general. (Ruben & Kim, 1975, p. 7)

Characteristics of an open system include: ordered wholeness; dynamic interaction; organized complexity; directiveness; control; self-regulation; differentiation; and cyclical behavior among its components:

![System diagram](image)

(Carlson, 1982)

3The function of this section is to barely introduce three underlying communication perspectives. Additional explanations appear throughout the text where needed.
An open system interacts with the environment. How one identifies the boundaries of the system determines what constitutes the components of the system and of its environment. For example, if one were to view a negotiation process as an open system, then the input would include both factual and inferential data that the communicators brought into the communication act. Output, in this context, is defined as the results of the negotiation which may include: agreement, compromise, stagnation, or alienation. Feedback describes new input generated from within the system as influenced by the dynamic characteristics of various system components. Restrictions include anything that might restrict the negotiation process; for example, global influences, perceived incompatible goals, cultural specific views, time limitations. Process becomes the communication transaction. The environment includes everything that is not a part of the negotiation system as defined.

Subsystems or subunits of a system are interrelated. Any change within a subsystem affects all components of that subsystem, other subsystems, and the system as a whole. Within a negotiation system there are numerous interrelated factors that affect communication. For example, political factors influence economic factors which in turn affect potential trade factors. The United States' political relationship with Taiwan, or United States' textile import policies, might influence China's willingness to buy U.S. wheat.

The equifinality and multilinear causality qualities of general systems serve to explain the complexity of the relationship between antecedent and consequent conditions in human systems. "One set of initial conditions can give rise to different final states, and conversely,
differing initial conditions may result in a single outcome" (Ruben & Kim, 1975, p. 2). A negotiator who recognizes both equifinality and multilinear causality may actively search for novel choices to achieve agreement. Thus, equifinality and multilinear causality may facilitate adaptation as needed for mutual problem-solving in the negotiation context.

Another adaptive quality may be derived from the balancing apparatus of open systems. "Balancing apparatus" refers to both dynamic and homeostatic characteristics within the interdependent subsystems. The principle of homeostasis serves to explain how these subsystems may achieve and maintain equilibrium. Thus, for the purpose of dealing with negotiation, the notion of open systems includes implications for achieving and maintaining dynamic equilibrium throughout the negotiation process.

General Semantics in Relation to General Systems Theory

Methods of thinking, feeling, planning, and deciding are not the same for persons who belong to different cultural groups. . . . (Bois, 1973, p. 4)

This statement implies a general semantics orientation. A misunderstanding of general semantics may be prevented by first noting what it is not. General semantics is not the study of a philosophical theory of signs and symbols and their function in languages; nor is it the study of meanings of symbols; nor is it a classification of changes in the signification of words or forms viewed as factors in linguistic development. Instead, general semantics deals with the relationships of symbolic meanings within and among human organisms. According to Alfred Korzybski, the founder of general semantics:
General Semantics turned out to be an empirical natural science of nonelementalistic evaluation, which takes into account the living individual, not divorcing him from his reactions altogether, nor from his neuro-linguistic and neuro-semantic environment, but allocating him a plenum of some values, no matter what. (Science and Sanity, 1948, p. viii.)

The study of general semantics shares some similarities with general systems theory. The human organism works as a whole. "Its activities are integrated in a central pattern that reveals the general orientation, the style of living of the individual" (Bois, 1973, p. 236). Included in this general orientation is the principle of nonelementalism. "The attempt to separate verbally what cannot be separated except verbally" is a definition of elementalistic behavior. To treat a part of anything as if it were the whole changes the system dynamics and characteristics of the components actually integrated, and thereby distorts the perception of the whole. The nonelementalistic orientation serves to prevent this kind of distortion.

An accepted notion among social scientists is that stereotyping is a common phenomenon among human beings. Walter Lippmann (1965) reminds us that stereotyping is "a way of substituting order for the great blooming, buzzing confusion of reality" (p. 64). Although stereotyping may help one to organize and classify a complex world of stimuli, this stereotypical process of generalizing can lead one to mistakenly overlook individual differences. Korzybski introduced extensional devices by means of which one may achieve an extensional orientation and thereby determine and design adaptations to the unique structure of each negotiation situation. These devices include:

1. **indexing**—the device for distinguishing between persons and between
situations; for instance, negotiator_1 ≠ negotiator_2, or negotiation
situation_1 ≠ negotiation situation_2; (2) dating—the name for the
temporal indexing device; for example, negotiator_1 at time_1 ≠ negotiator_1
at time_2; or negotiation situation_1 at time_1 ≠ negotiation situation_1
at time_2; and (3) the etcetera—the device for developing and maintaining
awareness that not all of the characteristics in any dynamic situation
can be abstracted or included; hence, it is a device for reminding
us of characteristics left out or omitted (Korzybski, 1941, p. xxxiiii). For
example, in a negotiation situation between representatives of
the U.S. and China, there might be no apparent awareness of the defection
of a Chinese tennis player to the United States—a fact which might
have major impact on the negotiators' "neuro-semantic environments."
In any case, an answer to the question "What will work, when, with
whom and under what circumstances?" depends upon the influencing factors
or conditions of a given situation.

In short, both general systems theory and general semantics are
holistic perspectives. Each perspective recognizes the interdependent
and dynamic characteristics of components of the whole. A
nonelementalistic orientation, which serves to prevent distortion
of the whole, is characteristic of both perspectives. While general
systems theory helps one learn to identify components of a negotiation
situation and discover how the components interact, general semantics
provides an orientation with explicit extensional devices and guidelines
for designing transactions.

Rhetorical Theory; Choice-Sharing Model

In Ancient Rhetoric and Poetic (1924), Charles Sears Baldwin
stated that:

The definition of rhetoric implied (by Aristotle) may be summed up in the word persuasion, if we are careful to speak of persuasion not as achievement, but as method. Just as we ask of medicine, not that it shall infallibly heal—a degree of achievement impossible in human affairs—but that it shall discern and use all the means of healing available in the given case, so the true end of rhetoric is to induce such habitual skill as shall discern in any given case the available means of persuasion. (p. 10)

Darnell and Brockriede (1976) refer to "choosing to make choices on the basis of the best information and reasoning available..." (p. 13). Each description of communication implies that "people are choice makers" (p. 13). What one communicates depends on choices and inferences that respondents make. Individuals "make choices and inferences in the context of what they know and believe and that situation as they perceive it" (p. 15). According to Darnell and Brockriede, control of communication may be achieved indirectly by (1) paying attention to the process, (2) paying attention to the person(s), (3) expending effort to expose (or conceal) choices actually made, (4) increasing the latitude of choices available (thereby increasing the choice-making capacity), (5) being aware of yourself, your behavior, and other influences, and (6) admitting that total control of another is not an option (1976, pp. 15-16).

The negotiator needs to invent\(^4\) data that are relevant and potentially

\(^4\)In the classical taxonomy of rhetoric "the process of 'finding out' what could be said about a subject" was treated under the heading of "invention." Under that heading, Aristotle distinguished between "inartistic" and "artistic" data. Inartistic data refers to "what we call research—the collection of factual data like statistics, statements of authority, laws, etc." Artistic data encompasses "interpretive evidence, or arguments, which define the significance of the data in relation to the goals and values of those involved in the decision-making process" (Harper, 1979, pp. 32-33).
acceptable to both parties in the particular negotiation situation. The negotiator then arranges data into rhetorical arguments that provide reasons for choices by the other party to shift "from one set of problematic ideas to the choice of another" (1976, p. 101).

When negotiators choose to govern themselves by the choice-sharing model, they cooperatively share aims and seek to discover choices that are mutually advantageous as they search for agreement through argumentation.

Critical Survey of Pertinent Research

I was unable to find a communication methodology for managing conflict through negotiation between representatives of two cultures in general; nor specifically, representatives of the United States and China negotiating a wheat deal. In an effort to determine whether such a methodology existed, I searched literature related to communication, sociology, psychology, social psychology, and political science and business. I looked for titles which contained any one, or any combination of the following topics: negotiation, bargaining, conflict management, conflict resolution, conflict mediation, intercultural, cross-cultural, international, China-United States, agricultural trade.

Searching for titles which contained these topics within the prescribed disciplines required some preliminary evaluation. I sought to determine the extent to which a resource had a direct bearing upon my research topic by determining relevance. Some sources, as indicated by the title, seemed promising but proved to have little relevant information. Other sources, though not directly related, provided
helpful background information. And some resources offered pertinent data useful for this study.

Two studies that seemed initially promising were historical analyses of official negotiations between the U.S. and China (Lall, 1968; Young, 1968). Although both references provided information regarding the "Chinese presence" (Lall, 1968)--insight into circumstances, procedures, and substance during negotiations--I was disappointed to discover little relevant data.

I found political science and economic studies about the United States diplomatic and trade relations with China (USCHRL, U.S./China Relations; see Preface to Bibliography on p. 263). Among them were views of U.S./China foreign policy which included historical perspectives, assessment of political implications, and predictions; inquiries into cultural exchange; and descriptions and analyses of economic trade agreements. These studies provided necessary background information regarding the climate of government relations and trade activities between the two countries.

I discovered additional references which focused on negotiation behavior between U.S. and China (USCHNG, U.S./China Negotiations). Included are studies dealing with Chinese tactics, comparative analysis of Chinese/Soviet negotiation behavior, and negotiation vis-a-vis foreign policy. These political-science studies focused on strategic international policies with little note of related communication processes.

On the other hand, a group of studies focused specifically on communication between cultures though not necessarily in a negotiation
context (ICC, Intercultural Communication). A prevalent orientation is that the practice of intercultural communication is an art which requires an understanding of the audience's culture and adaptation to that culture. "What is a successful technique of communication in one culture could be a failure in another" (Sitaram, 1978, p. 346). While this point of view is compatible with the perspective of my study, it did not seem to be represented among the studies that related to international negotiation.

Among a number of international negotiation (INTLNG, International Negotiations) references were sociopsychological studies which integrated empirical observation and theory. One such source was Iklé's (1964) analysis of negotiations between governments which relates the process of negotiating to the negotiation outcome. His premise is that two elements must normally be present for negotiations to take place: common interests and issues of conflict. He distinguished between two kinds of common interests: substantive common interests in which parties want to share the same object or benefit from the same arrangement; and complementary interests in which parties are interested in an exchange. According to Iklé, most negotiators embrace a combination of substantive interests and complementary interests. This viewpoint may help in assessing the common interests between U.S. and Chinese as negotiators search for agreement in a wheat deal.

International negotiation studies within the political-science context provided little communication relevance; however, political scientist Robert C. North (1977) developed a framework for analyzing international conflict with a systemic orientation which provided
useful insight. In addition, professional negotiator Roger Fisher (1969) developed a prescriptive guide for international negotiators which (although it is not a methodological framework) suggests potentially useful tactics and strategies.

On a broader scale, I looked at social negotiation studies in general (SNG, Social Negotiation). These studies included: the development of theoretical models; an analysis, justification and integration of existing theories; interpretation of theories as related to process and outcome; a focus on labor negotiations and collective bargaining; and prescriptive guides which contained tactics, strategies, and methods for successful negotiation outcomes in a business context. These studies were relevant only insofar as they broadened my understanding of negotiation.

I did discover a methodology with a communication emphasis in Nierenberg's approach to negotiation (1972, 1973). Although he does not specifically address cross-cultural negotiation, China-U.S., or agricultural trade, his premise that "in a successful negotiation everyone wins" (1973, p. 1) proved pertinent. He emphasizes communication skills and strategies and "creative-alternative attitudes" employed in the "cooperative process" of negotiation (1973).

A number of social negotiation authors discussed contrasting negotiation characteristics. My initial interpretation determined all comparisons to be relevant inasmuch as the focus of this study examines contrasting negotiation approaches. Walton and McKersie's (1964) analysis of integrative versus distributive negotiation patterns and Nierenberg's (1983) distinction between win/win negotiation and
negotiation by negation were highly pertinent. A communication characteristic apparent in both Walton and McKersie's comparative contrast and Nierenberg's comparative contrast is the distinction between sharing choices and restricting choices. The comparative characteristics discussed in the other sources mentioned might help to explain specific phenomena within a particular negotiation, perhaps at the subset level in relationship with the two contrasting approaches of this study.

Two authors within the conflict analysis literature provided relevant viewpoints. Kenneth Boulding (1962) indicated a preference for the label "conflict management" as opposed to "conflict resolution." He notes that "frequently conflicts are not, and perhaps should not, be resolved, but should be managed, at least to maximize the total gain to both parties" (1962, p. 343). Rummel (1977) developed the "conflict helix" as a way of analyzing conflict and explained it as a "dynamic swirl of manifest activity and latent potentialities and dispositions, but with order and direction" (p. 23). He distinguishes between different kinds of societies and their patterns of conflict diffusion, which is helpful in determining potential differences between American and Chinese societies.

Nowhere in my search of literature did I find a communication methodology for negotiations between representatives of two cultures. I did, however, find a supply of data with varying degrees of relevance which provided background and substance for this study.
Research Design

The research design for this study requires a model for generating a methodology. Leonard C. Silvern developed such a model (Lippett, 1973). A modification of Silvern's model provides the structure for the design of this methodology.

Silvern's model is based upon the anasynthesis process which consists of four parts: analysis, synthesis, modeling, and simulation. According to Silvern "analysis is performed on existing information, synthesis is performed to create a new whole, models are constructed . . . and simulation is performed" (Lippett, 1973, p. 123). The model of this methodology includes the analysis, synthesis and modeling steps. Instead of simulation, however, this methodology will be illustrated by generating communication strategies appropriate for the constructed negotiation situation, and evaluating the strategies according to the standards set forth in the context of this study.

Analysis

The first step was to gather and analyze any pertinent research material dealing with agricultural negotiations between the U.S. and China. From these data, I constructed a realistic negotiation situation. The negotiation formulation includes: (1) a structure of the interrelationships among relevant negotiation factors; (2) a comparison structure representing choice-sharing and choice-restricting negotiation dialog between U.S. and Chinese negotiators; and (3) prospective negotiation outcomes.

Each aspect of the negotiation situation is analyzed from three integrated points of view, all grounded in the rhetorical perspective:
(1) argumentation theory based upon sharing choices versus restricting choices; (2) intelligence information processing based upon heuristic problem-solving guidelines; and (3) Nierenberg's distinction of contrasting approaches—win/win negotiation versus negotiation by negation.

Argumentation theory: Sharing choices versus restricting choices. According to Brockriede and Ehninger (1960), Toulmin describes argument as "movement by means of which accepted data are carried through a certifying warrant to a claim" (p. 47). Campbell (1982, p. 194) showed the structure of any argument:

Evidence or Data ______________________ (Therefore,) Claim or Conclusion

(Since) Warrant or Reason

These authors agree that claims are assertions beyond what can actually be proved. Warrants are the grounds or bases for drawing conclusions. They legitimize the leap between data and claims. Warrants arise out of knowledge accumulated within a specific context.

A particular kind of argument found in rhetoric is the enthymeme. Enthymematic conclusions are plausible rather than certain.

The enthymeme is normally deficient in terms of strict logical standards, and its subject matter is concrete and specific rather than abstract. However, what distinguishes the enthymeme is that it is constructed from the beliefs, attitudes, and values of the audience. An enthymeme is an argument jointly created by author and audience. It is an argument that gains its force from the fact that the audience fills in the evidence or supplies the warrant or draws the conclusion. A rhetor can plan such an argument, but the argument cannot be made unless the audience supplies essential parts of it. (Campbell, 1982, pp. 204-205)

The enthymeme (rhetorical syllogism) can be likened to Polya's

\[5\] Virtually all arguments that appear in ordinary discourse are formally deficient. (Anderson and Mortenson, 1967)
heuristic syllogism as distinguished from the demonstrative (deductive) syllogism. Both patterns have a similar logical nature; however, the heuristic syllogism is a pattern of reasoning that "exhibits a reasonable ground for a change in the level of confidence" (Polya, 1945, p. 186). It does not have the deductive certainty of a demonstrative syllogism, yet is useful in acquiring essentially new knowledge through the process of "plausible reasoning" (p. 188). A comparison shows the differences between the minor premises--hence between the conclusions--of the two kinds of syllogisms:

<table>
<thead>
<tr>
<th>Demonstrative</th>
<th>Heuristic</th>
</tr>
</thead>
<tbody>
<tr>
<td>If A then B</td>
<td>If A then B</td>
</tr>
<tr>
<td>B false</td>
<td>B true</td>
</tr>
<tr>
<td>A false</td>
<td>A more credible</td>
</tr>
</tbody>
</table>

(Polya, 1945, p. 188)

When constructing a demonstrative (deductive) syllogism--like a closed system--a negotiator provides evidence to support its premises within the scope of which the choices (of the other) are limited. When constructing an enthymeme, a negotiator provides evidence and suggests options to the other from which that individual may choose a plausible conclusion. The function of the enthymematic argument depends upon sharing choices. A series of shared choices and plausible conclusions may--or may not--establish a credibility trend.

Darnell and Brockriede (1976, p. 20) distinguish between extreme dimensions of choice a person has in communication with another person:

<table>
<thead>
<tr>
<th>Sharing Choices</th>
<th>versus</th>
<th>Restricting Choices</th>
</tr>
</thead>
<tbody>
<tr>
<td>Seeing other as person</td>
<td></td>
<td>Seeing other as object or victim</td>
</tr>
<tr>
<td>Win/win or lose/lose</td>
<td></td>
<td>win/lose</td>
</tr>
</tbody>
</table>
Cooperative aim ← → Competitive aim
Power parity ← → Maintain or gain power
Share the choice ← → Restrict choice
Risk change ← → Risk stagnation
Bilateral view of relation ← → Unilateral view of relation

These authors note that choices can be restricted by coercion or by providing another person with the illusion of choice. The choice of arguments in a negotiation situation is determined by that communication orientation which is characterized by the negotiator's willingness and ability to share choices or restrict choices.

Intelligence information processing: Heuristic problem-solving.

Invention refers to the "discovery of all available means of persuasion in any given case" (Harper, 1979, p. 32). Invention encompasses the collection of factual information, statistics, statements from authorities, and laws (inartistic data). However, these data are virtually impotent until combined with interpretive evidence or arguments that are significant from the perspective of those involved (Harper, 1972).

Invention also encompasses the systematic accumulation of collected data by way of intelligence gathering methods (in the diplomatic or military sense) enabling the "inventor" a means by which to make plausible inferences about a particular set of circumstances. Intelligence is based upon interpretation of facts within the framework of the problem (artistic data).

Purely deductive and analytical problem-solving methods are impractical for the collection of intelligence. Instead, methods
of "modern heuristic" which involves the use of inductive and inferential processes are needed (Oneill, 1964). "Heuristic reasoning is reasoning not regarded as final, but provisional . . . (Its) techniques are built upon human patterns and processes of learning, information processing, and problem-solving approaches" (Oneill, 1964, p. 7). A heuristic application of problem-solving serves to guide, discover, or reveal information that is incapable of proof.

Intelligence gathering includes an analysis of the "audience"--in this case Chinese negotiators--in relation to relevant factors within the particular negotiation situation. Negotiation factors might include: (1) culture-specific customs, and related beliefs, attitudes and values; (2) history of diplomatic and trade relations between U.S. and China (to include previous or pending agricultural agreements); (3) current agricultural situation in China relative to prospective wheat imports; (4) global economic climate encompassing the wheat market; (5) location, timing, language translation and other factors related to immediate negotiation contact. Accordingly, a professional negotiator might have a staff of experts available to provide the necessary information, including specialists such as a sociologist, linguist or translator, agricultural trade specialist, political scientist, economist, historian, cultural anthropologist, and accountant.

Win/Win negotiation versus negotiation by negation.

Basic ingredients of a win/win negotiation approach according to Nierenberg (1973) are knowledge of human behavior, careful preparation, assessment of assumptions of both parties, and conditional use of communication strategies and techniques. He emphasizes cooperation
in which "all parties in a negotiation should come out with some needs satisfied" (p. 27). This orientation stresses the need for creative-alternative attitudes which are characterized by the search for novel choices aimed toward agreement among negotiators—not total victory or one-sided advantages.

Nierenberg contrasts a win/win orientation with negotiation by negation (1983) in which "appearance is everything, substance is nothing; one side wins everything, the other side loses all" (p. 76). A negotiator using a negation orientation treats the negotiation process as a game, with a winner and a loser, and restricts choices in order to gain an advantage.

Synthesis and Modeling

The components of the methodology, represented by Figure 1, were derived from an analysis of the formulations exemplifying two contrasting negotiation approaches in the context of the realistic wheat negotiation between representatives of the U.S. and China. I compared the structure of each negotiation approach, then formulated a model methodology for planning communication strategies designed for a wheat negotiation between representatives of a U.S. wheat trading company and China.

To use this methodology, negotiators must first survey the negotiation system, and map the structure of relevant negotiation factors. From the structured data, negotiators then formulate a structure of unknown relevant data and thereby determine needed expertise for negotiation team membership. The next phase is to design a system of communication strategies. At this point negotiators interpret the situational factors, diagnose the potential rhetorical obstacles related to each factor,
Figure 1. Model for Generating a Methodology.
and then generate appropriate communication strategies designed for the particular situation. During the final phase of negotiation planning, negotiators evaluate the selected negotiation strategies according to standards set forth in the methodology.

The bias of this methodology would lead a negotiator toward sharing choices instead of restricting choices. However, the choice of tactics and strategies to be applied during negotiation depends upon the particular situation and the extent to which the other party is willing to cooperate.

Illustration of the Methodology

The potential usefulness of the methodology is illustrated by (1) generating communication strategies as if I were a representative of a U.S. wheat trading company negotiating a wheat contract with representatives of China; and (2) evaluating the selected strategies according to rhetorical standards introduced into the methodology and according to U.S. and China's plausible wheat agreement criteria; thereby, (3) evaluating the functioning capability of the communication methodology.

Assumptions

(1) The two parties in a negotiation situation desire to reach an agreement.

(2) The goals of each of the two negotiation parties are potentially conflicting.

(3) People are choice makers (Darnell & Brockriede, 1976); however, the choices available to negotiators of both nations may be limited
by the particular circumstances.⁶

(4) There are multiordinal levels of conflict: potential and manifest
(Rummel, 1977).

(5) It is necessary to make inferences based upon existing pattern
properties in order to make judgments about appropriate
communication strategies.

Limitations

(1) In the context of this study "negotiation" implies seeking agreement
by means of communication tactics and strategies. Negotiation
is a subset of communication.

(2) While actual transcripts of communication dialog between
representatives of the U.S. and China may not be available, the
formulation designed to realistically exemplify contrasting
negotiation approaches—constructed from researched information—
serves to illustrate the usefulness of the methodology.

⁶The Deputy Director of Economic Affairs, U.S. State Department,
noted that Chinese negotiators have a wider range of discretion now
than they have had in previous years (see p. 70); however, the general
pattern (reported among authors who have researched U.S. and Chinese
business negotiations) indicates that Chinese negotiators experience
more constraints than do U.S. negotiators. Examples of sources of
constraints on U.S. or Chinese negotiators or both include the following:
(1) U.S. negotiators would need authorization from the chief
executive officer (or comparable authority) of the U.S.
company if that individual was not present at the
negotiation sessions (see p. 151).
(2) Chinese negotiators may need authorization from government
officials not present at the negotiation sessions (see
pp. 102, 169, 226).
(3) Chinese negotiators may need authorization from the Bank
of China (see p. 73).
(4) Both the U.S. and Chinese negotiators would be limited
by the terms of the Government Grain Exchange Agreement
(see page 39).
(3) The data used to create the realistic negotiation situation were based upon the statistics available at the time that this thesis was designed; so, the numbers may be dated. However, there is no necessary connection between the recency of the data available and the communication strategies generated by means of the methodology.

(4) Whether, or the extent to which, the results of the present study can be generalized remains to be determined by replications with different commodities and cultures (Brinberg & McGrath, 1985). Meanwhile, there is no reason to assume that the relationships among the components of the present methodology cannot remain invariant across a variety of goods and services in different sets of circumstances. It seems plausible to hypothesize that this methodology would be useful for planning: (a) a wheat negotiation with Russia; (b) a center-pivot-irrigation negotiation with China; (c) a fertilizer negotiation with Argentina; or (d) any other negotiation for which the preparations require unique communicative designing—like architectural methodology.  

7See Epilogue.
Chapter II

A FORMULATION OF TWO CONTRASTING COMMUNICATION APPROACHES
GROUND ED IN ONE NEGOTIATION SITUATION

The first step in constructing a communication methodology for use by negotiators representing a U.S. wheat company while planning and negotiating communication strategies in the context of a wheat negotiation with representatives of China, was to create a realistic negotiation situation. I deliberately constructed one negotiation situation to remain constant while making a systematic comparison of two contrasting examples of dialog within that situation. The two versions of dialog were created by adopting two different models of human communication: one, dictated by a choice-sharing approach; the other, dictated by a choice-restricting approach.

The data for constructing the realistic negotiation situation (documented in the bibliography; dated from 1968 to 1985) were drawn from studies of commercial negotiations between the U.S. and China, wheat trade reports from agricultural journals, research analyses by China trade specialists, USDA government documents, and news publications reporting pertinent events.

With a systemic orientation, I combined and arranged the data in a structure designed to serve the subsequent purpose of analysis for this thesis. Figure 2 is intended to show that the immediate context of this negotiation situation is a function of relevant factors within a broader context. The overlapping circles represent the interrelationship among negotiation factors; however, no attempt was
Figure 2. Formulation of Two Contrasting Communication Approaches Grounded in One Negotiation Situation.
made to represent the degree of interrelationship among factors. Nor does the size of any one circle represent a specific level of importance in relationship to any one of the other circles. For example, China's need for wheat may be a greater factor for consideration in a Chinese negotiator's mind than is his reluctance to buy U.S. wheat because of China's disenchantment with the U.S. textile-import policy. Notice that the dialog sectors could emerge from any two portions or segments of the diagram.

The circle representing the immediate context is deliberately placed within the set of overlapping exterior circles representing the generic context. Elements of the immediate context include: agenda, location, personnel, and procedural considerations. Each of the generic-context circles represent assumptions about what might affect this negotiation situation according to indications found in the literature. (The numbers of the following assumptions correspond to the numbers on the diagram.)

(I) Relevant Chinese cultural characteristics—including beliefs, attitudes, and values—are likely to influence the Chinese delegates while negotiating.

(II) China's willingness to conduct business with the United States is presumably influenced by U.S./China trade balance and by political and diplomatic relations.

(III) An assessment of China's need for wheat is a relevant factor when considering population growth, food productivity potential and quality of diet.
(IV) The global wheat situation is a significant factor as negotiators evaluate price, quantity, and quality of wheat available on the global market.

Given the foregoing structure of the negotiation situation, my next task was to construct two contrasting examples of dialog as realistically as possible from selected data derived from the literature. The dialog section of this chapter appears after (1) a detailed structure of relevant negotiation factors, and (2) an explication of the choice-sharing and choice-restricting communication model.

For the sake of flexibility, and for the convenience of the reader, I chose to present the structured negotiation situation to be analyzed on the left side of the page with corresponding explanations, and documentation as needed, on the right side of the page. The outline symbols which represent the data on any given page appear on the upper right-hand corner of that page.
Components of a U.S./China Wheat Negotiation

The examples of dialog in the last section of this chapter are a function of the immediate context which is viewed within the context of the global wheat situation, and, in turn, in the context of China's need for wheat, the relevance of which is determined by China's willingness to trade with the United States. All of these components are presumably grounded in Chinese cultural factors relevant to negotiation--the most nebulous among all factors to be considered.

(I) Relevant Chinese Cultural Factors

According to the literature, potentially relevant Chinese cultural characteristics may include: (A) indications of ambivalence toward Westerners, specifically the U.S.; and, (B) indications of a holistic orientation toward negotiation in general.

(A) Ambivalence Toward Westerners

Sources suggest that while the Chinese remain cautious in their attitudes toward the West, they are, at the same time, interested in learning about "Western ideas." In 1979, leaders of China launched
a massive program for the "comprehensive modernization of China's agriculture, industry, national defense, and science and technology."

In an effort to expedite their "Four Modernizations" program, China seems to be looking toward the West for ideas and inspiration.

For example, "in 1982 alone, eighty Chinese delegations per month visited the U.S. . . . and 100,000 Americans were granted visas by the Chinese government to visit China" (Terrill, 1983, p. 20). An agricultural researcher from Shanghai University, member of a Chinese delegation visiting the U.S. in November, 1983, stated in conversation with
According to Lucian Pye, commercial negotiation specialist:

Among the Chinese, particularly those called upon to negotiate with foreigners, there are widespread feelings of ambivalence about all that is foreign. Pulling in one direction is a mixture of distrust and distaste for the foreign and respect for Chinese traditions and commitment to Chinese nationalism. . . . At the same time, pulling in the other direction, particularly during periods when modernization has been legitimized, is the alluring attraction of the industrialized world, which seems to possess so much that the Chinese want.

Pye (1982, p. 60) claims: "American and Japanese accounts indicate that Chinese negotiators seem to be simultaneously extremely suspicious [of foreign business people] and also anxious for [their] friendship. . . . Considerations suggest that the extreme sensitivity of the Chinese reflects a fear of being cheated by dangerous foreigners and competes with an equal desire to be protected by the understanding of foreigners."
Negotiation Orientation

Four ways in which cultural factors may affect the Chinese negotiation orientation in general include: (1) an unhurried manner focused upon developing friendships; (2) the tendency to seek general agreement before agreement on specific details; (3) a tendency toward ambiguity, for example, the "avoidance of an unambiguous 'no'"; and (4) the apparent high value placed upon on-going relationships.

(1) Friendship Value

Through the vehicle of friendship, the Chinese "shape the atmosphere surrounding negotiations." Preliminaries to negotiation include leisurely sightseeing trips, banquets, and visits to factories and communes. A U.S. commercial negotiator in China agrees. "They are ever gracious hosts [making it] pointless to try to speed up the preliminary process of becoming friends. As does the entire trade procedure with the Chinese, business proceeds according to their schedule."
(2) General to Specific

Once negotiations are underway, the pattern suggested throughout the literature is that "Chinese negotiators begin with a rather general set of principles—for example, the goal of equality and mutual benefit—and from that develop agreements that rely extensively on oral understanding."

According to Pye, "The Chinese seek agreement on generalities, dwelling on overall considerations... leaving concrete arrangements and specific details to later negotiations."

(3) Ambiguity or Contradictions

Sources describing the Chinese negotiators suggest that they seem
to be masters of ambiguity and contradictions. Lall reports that "the Chinese appear to have accepted the fundamental role of contradictions in every sphere of life, policy and action." Pye offers this opinion: (The) "Chinese consciously use a sweet and sour approach to remind the visitor that friendship is not the only thing they know and that they can be tough minded when necessary." He also noted, "the Chinese negotiator will often avoid an unambiguous 'no' . . ., but will 'take note of your position' and suggest going on to another point."

Assuming that the Chinese negotiation representative may be typical of what is claimed generally among Chinese people, there is no reason to exclude nonverbal communication from the dimension of ambiguity. For example, Samovar and Porter (1976), intercultural communication scholars, note that "the Chinese do not readily show emotion. Chinese children are conditioned
(4) On-going Relationships

Another cultural characteristic that may hold potential significance during this negotiation situation is the apparent value the Chinese place upon on-going relationships. A Chinese negotiator "while concerned with the bottom line is not single-minded about it as many Westerners are. Rather, he proceeds with a dual awareness that there is a second ledger in which 'success' is debited or credited in terms of contribution to the quality of relationships that ensue..." (Pascale, 1978, p. 162)

According to Pye (1982, pp. 78-79) "previous U.S. negotiators describe their surprise when the Chinese officials brought up proposals for revising what had been agreed upon, right on the heals of signing a contract." He noted that "although they..."
are reportedly scrupulous in adhering to agreements, they have no inhibitions in proposing changes" . . . which may suggest an attitude of "continuous negotiations. . . ."

(Transition: In addition to Chinese cultural characteristics related to negotiation, a potential U.S. negotiator may need to consider China's willingness to negotiate.)

(II) China's Willingness to Do Business with the U.S.

Among the considerations affecting China's willingness to deal with the U.S. in general are:
(A) balance of trade issues; (B) political and diplomatic relations between the two countries; and (C) China's interest in U.S. technology.

(A) Financial and Trade Issues

The figures documented in the literature indicate that a trade inequity exists between the U.S. and China attributed to U.S. textile import restrictions.

(1) Trade Inequity

For example, "in 1980, of the $4.81 billion of goods and services that were exchanged bilaterally between U.S.
and China, $3.75 billion represented U.S. exports to China and only $1.6 billion consisted of Chinese exports to the U.S."

A farm analyst noted that "China must have foreign exchange. She must be able to sell her products in the world markets, including the U.S. if she is to buy our wheat, soybeans, corn..."

(Graham, 1981, p. 14)

A Chinese Ministry's spokesman, Peng Shen, noted that "of all U.S. imports, only .65% comes from China" (White, 1983, p. 48).

(Jaenke, 1983, p. 4)

The December, 1983, World Agricultural Outlook and Situation Report states that "The strong U.S. dollar will probably continue to dampen overseas demand for U.S. exports. Given forecasts of high real U.S. interest rates continuing to attract foreign capital in 1984, it seems doubtful that the dollar will depreciate substantially" (p. 3).

(2) Textile Imports Relative to Grain Exports

A significant factor contributing to the imbalance of trade between the
U.S. and China is the U.S. restriction of Chinese textile imports relative to the U.S. grain (specifically wheat) exports to China.

(a) **Import Restrictions**
Under the present Multifiber Agreement (MFA) system, "the U.S. imposes quota limits on specific textile goods imported to the U.S. . . . ." 

China was a "new entrant" in the world textile market, and therefore requested a larger share of U.S. textile import growth than the MFA allowed.

(b) **Decreased Grain Trade**
Although recent negotiations between U.S. and China produced a revised textile agreement

During the 1970s, as the U.S. economy slowed, the "U.S. government entered in an 'umbrella' MFA, . . . in an effort to protect domestic industry against what they viewed as unfair competition" (Graham, 1981, p. 15).

The new five-year agreement modified
(August, 1983) which "ended a yearlong trade dispute," earlier disagreements regarding import quotas had led the U.S. to suspend "all Chinese textile apparel imports at existing levels" (January, 1983). China responded to the January, 1983, textile suspension by "banning the purchase of soybeans and cotton, and limiting the purchase of grain from the U.S." Three years before (October, 1980), the U.S. and China had signed a five-year grain exchange agreement providing for the purchase of between six and eight million metric tons (mmt) of U.S. grain each year.

China's participation in the MFA system by allowing a 3.5% annual growth of Chinese textile shipments to the American market. The agreement allowed considerably less than the 6%-7% annual growth in the three year U.S./China agreement that expired December 31, 1982," but was "much more than the .5%-.7% allowed the big three textile sellers: Hong Kong, South Korea, and Taiwan" (Associated Press, Omaha World-Herald, August, 1983). (Associated Press, Omaha World-Herald, July, 1983)

A metric ton is equal to 2,204 pounds according to Kent Warneke, Farm Writer, (Omaha World-Herald, February, 1983).

According to the 1980 grain agreement, 15%-20% of the total amount of grain sold annually is to be corn; the remaining amount, wheat. Under this
"However, according to USDA's latest accounting, sales totaled only 3.83 mmt in 1983. The shortfall was a result of a trade dispute over U.S. import restrictions on Chinese textiles."

"So far in 1984, including the latest sales, a total of 2.26 mmt, all wheat, has been purchased. China, however, has indicated to U.S. officials that it would live up to the agreement by making up for last year's shortfall.

Although the August, 1983, textile agreement lifted the U.S. freeze on Chinese textile
import growth, "both sides were hurt. China lost dollars needed to buy grain and modernize, and the U.S. wheat exporters suffered an estimated loss of $550 million . . . ."

(B) Political and Diplomatic Relations

The literature suggests that issues relating to U.S./Chinese political and diplomatic relations have an affect upon China's willingness to negotiate with the U.S.

(1) U.S. Relationship with Taiwan

Among the most significant factors affecting U.S./Chinese association is the U.S.'s relationship with Taiwan.

(a) Chinese Condemnation

According to Associated Press news service, Beijing, "In December, 1983, China's official Xinhua News Agency reported that the standing committee of the
National People's Congress had passed a resolution condemning the U.S. Congress for recent measures reflecting a 'two Chinas policy.'

(b) Sino-American Communiqué

One year before, "warnings from China specialists of disastrous strategic consequences led to the signing of a Sino-American Communiqué" (August 17, 1982) in which the U.S. promised to "limit" arms sales to Taiwan. However, arms sales continued and "Beijing soon renewed complaints about U.S./Taiwan relations."

In 1979 the U.S. signed two agreements which reflect the "two Chinas policy" referred to by Chinese leaders:

1) The Taiwan Relations Act "guarantees the security and well being of the people of the Republic of China (Taiwan)" (Townsend and Bush, 1981, p. 15).
(2) The Joint Communique ended official relations with Taiwan by acknowledging that "the People's Republic of China is the sole legal government with representation in the United Nations." (1981, p. 15).

Premier Zhao Ziyang was recently quoted in Beijing:
"The U.S.'s ties with Taiwan continue to trouble Chinese-American relations." (Associated Press, Beijing; Sioux City Journal, December, 1983)

(2) Chinese Defection; U.S. Political Asylum

Another issue which may have an affect on a Chinese negotiator's willingness to trade with the U.S. is the U.S. role in the 1983 defection of a Chinese citizen. For example, according to a news report from Beijing, "Chinese Foreign Ministry condemned the United States for granting political asylum to tennis star Hu Na, 19, and said the action 'will further damage relations between the two nations.'" (Associated Press, Beijing; Omaha World-Herald, April, 1983).
(C) China's Interest in U.S. Technology

To balance the potentially negative factors influencing China's willingness to trade with the U.S. is China's increasing interest in U.S. technology. According to a recent news report, "During his January 1984 visit to Washington, China's Premier Zhao Ziyang highlighted what is expected to be an increasing interest in U.S. exports of high technology products to China."

According to bibliographic sources, China is seeking to acquire the following types of technology:

(1) computer technology and related products,

(2) military technology,

(3) nuclear energy technology, and

A major topic discussed during Premier Zhao's 1984 visit to the U.S. was the proposed agreement on peaceful nuclear cooperation. According to U.S. officials, "China has edged significantly closer to accepting safeguards specified in the U.S. Atomic Energy Act, and insisted on by the U.S. as essential for congressional approval of a nuclear cooperation agreement" (Associated Press, Washington; Omaha World-Herald, January, 1984).

(4) agricultural technology.

China's plans to mechanize the agricultural sector include:
(1) agriculture machinery, e.g., sprinkling irrigation systems,
(2) seed processing machinery; drying, testing, and grading of seed,
(3) agriculture chemicals; pesticides, herbicides, and fertilizers,
(4) feedstuff industry; e.g., alfalfa dehydration plants,
(5) food-processing industry; for example, automated bread production (Buxbaum, et al., 1982, p. 68).
(III) China's Need For Wheat

As a prospective negotiator views the factors influencing China's willingness to trade with the U.S., grounded in relevant Chinese cultural characteristics, another factor to be considered is China's need for wheat. China's wheat need is a function of potential supply and projected utilization factors.

(A) Supply

According to agricultural researcher, F. Surls, China's supply of wheat is determined by (1) domestic production, and (2) importation.

(1) Domestic Production

"China is a large food grain producer" ranking second among the world's wheat producing countries.

\[
\begin{array}{cc}
\text{U.S.} & \text{China} \\
1982 & 76.5 & 68.4 \\
1981 & 76.0 & 59.6 \\
1980 & 64.6 & 55.2 \\
\end{array}
\]

(China, Review of Agriculture in 1981 and Outlook for 1982; USDA, 1982, p. 4)

Comparison Table of U.S./China Wheat Production (mmt)

(Wong, 1980, p. 1)

(Agriculture Statistics, 1982; USDA, 1982, p. 10)
(a) Modernization

Modernization of the agricultural sector has been a key focus of the Four Modernizations program implemented by Chinese leaders in 1979. (Buxbaum, et al., 1982, p. 70)

China made public the major goals outlined in their Sixth Five-year Plan (1981-1985). Among major objectives is to "increase agricultural production and gross value of agricultural output (GVAO)" (China: World Agricultural Regional Supplement; USDA, 1982, p. 8).

See "agriculture technology" and corresponding right-hand column for a sampling of agricultural modernization plans (preceding outline, section II/C/4).

(b) Incentive Plans

In addition to mechanization advancement, government officials have promoted production incentives plans which have "already produced impressive results." (World Development Report, 1983; World Bank Publication, 1983, p. 54)
"In 1979, China embarked upon a 'rural production responsibility system' which includes: greater decentralization of production and investment decisions to enterprises and farms; and stronger incentives, with more direct links between material rewards and the work of households and individuals...

... [For example], beyond [government] obligations, which account on the average for one-third of a household's total production, farmers can keep whatever they produce" (World Development Report; 1983, p. 54).

For example, "the gross value of agricultural output (GVAO) rose 11 percent from 1981 to 1982."

"GVAO has grown at an average annual rate of 7% since 1978" (China World Agricultural Regional Supplement; USDA, 1982, p. 2).

As a result of new programs, China's wheat yields have increased steadily since 1978.

(China World Agricultural Regional Supplement; USDA, 1982, p. 21)
"Good weather in China was an important factor in high yields and record crops in 1982. ... Weather continues to be a major factor in yield until more water control mechanisms are implemented" (China World Agricultural Regional Supplement; USDA, 1982, p. 10).

(c) Production Output Relative to Input

According to China's agricultural researcher, F. Surls, China is now "faced with the task of trying to sustain growth in agricultural productivity." China agricultural economic analysts offered this opinion: "Given China's land resource constraints and the disparate topography and climate ... the attainment of an overall growth rate of agricultural production ... has been a remarkable achievement. Despite this favorable record, the efficiency of agricultural production measured by growth in output
relative to growth in input has been declining."

(Barker, Sinha, and Rose, 1982, p. 9)

These authors go on to speculate that "Whether this (decline in output) has been due to the process of collectivization itself, the mismanagement of agricultural resources, or the limits imposed by diminishing returns on an already highly developed land base is a matter of open debate among scholars" (1982, p. 9).

According to a USDA report, "China farmers cannot meet the demand for greater output by expanding cultivated land area. They already are fully using available arable land, and the small, increasingly costly results of reclamation work are largely offset by the amount of cultivated land used up by new factories, roads and housing projects. . . . When there is an increase in the sown area of one crop, there will generally be a corresponding decrease in the area of some other crops" (China World Agricultural Supplement; USDA, 1982, p. 9).
(2) **Importation**

China supplements its wheat production by importing the balance of total need quantities. According to USDA analyst, F. Surls, "The key feature of China's agricultural imports is uncertainty."

Although importation has been a source of wheat supply in China, the levels of wheat imports have declined perhaps because of recent increase in domestic wheat productivity.

F. Surls noted that "China's agricultural trade policy appears to be one of import substitution, a policy whose objective is to halt the growth of agricultural imports and perhaps ultimately reduce them."

---

*(Associated Press, Washington; Omaha World-Herald, March, 1983)*
(B) Utilization

Factors that may affect China's utilization of wheat include: (1) current population and projected rate of growth; and (2) variation or improvement of diet.

(1) Population

"At the time of China's first national census taken in July, 1982, the population figure was 1.008 billion" representing approximately 25% of the global population. According to authors of the population bulletin, "Interchange," "Chinese leaders face a basic challenge: how to feed a population which is over one billion and growing. It is a race between population growth and agricultural production."

"Among the ways Chinese leaders are facing the challenge of feeding its people is the implementation of incentive programs designed to curb the population growth rate. "Deterrents include stressing late marriages and one child families."
As a result of these programs, the annual rate of population increase has gradually been pushed down from more than 2% to less than 1% with the goal of "zero population growth by the year 2000."

Upon consideration of factors which may influence China's population projections, Tien Yuan, population researcher, concludes that "What the future holds for China's population is unclear."

"Those couples who pledge to have no more than one child receive 'only child glory certificates.' These certificates entitle couples to various benefits such as free medical care and school tuition for their child, monthly cash bonuses or work points (for extra food and supplies). . . . Penalties for those who break the pledge by having a second child must return all benefits . . . a third child can mean their monthly wages are reduced by 10 percent or more" (May, 1983, p. 3).

(A statement by the present Chinese leadership according to Barker, Sinha, and Rose, 1982, p. 7)

(Tien, H.Y., 1983, p. 21)
For additional information about China's population, factors affecting continued effectiveness of rate of growth incentives, and growth projections, see Tien, H.Y., China: Demographic Billionaire, 1983.

(2) Improved Nutrition or Diet Variety

In addition to the governmental policies affecting population growth, official efforts are aimed toward improving nutrition and diet variety. According to F. Surls, China agricultural analyst, "ultimately a reduction in population growth coupled with rising incomes will lead to demands for a more varied diet" ("Foreign Trade and China's Agriculture," in The Agricultural Economy of China; ed. Barker, Sinha, and Rose; 1982, p. 93).

Mattern, wheat quality analyst, noted that "national policy promotes improved nutrition and more variety" ("Report on Milling Technology"; U.S. Wheat Association, 1983, p. 8).

Official objectives that may contribute to both improved
nutrition and diet variety are:
"an increase of manufactured
production of baked bread, noodles,
and other convenience foods." (Buxbaum, et al., 1982, p. 72)

These products would supplement the
traditional steamed breadyings and dumplings
available in China (Mattern, March, 1984).

The U.S. Wheat Association has
organized a U.S./China demonstration bakery
which "prepares bread from a shipment
of hard red winter (HRW) wheat flour
donated by Minnesota wheat growers" (Mattern, 1983, p. 2).

China wants to move toward
more mechanized bakeries, including
"fast-food type" bun factories,
however, "the quality of available
Chinese flour does not presently
meet the requirements for a
functioning plant."

According to Mattern, production of a
fast-food type bun, by U.S. standards,
requires a minimum of approximately
13.5%-14% protein
(11.5%-14% for baked loaf production),
and a maximum of approximately .43% - .57% ash, per unit weight (approximately 12% "as is" moisture content).

Bread characteristics affected by protein content include: product uniformity, crumb properties, and dough consistency necessary for bakery machines to function properly.

Characteristics affected by ash content include: color and texture. Both ash and protein contribute to nutritional content.

According to Mattern, China has traditionally imported a lower quality soft red winter (SRW) "ordinary" protein which measures approximately 9%-11% protein, and up to 1.2% ash ("as is" moisture levels).

The table below illustrates the comparison of wheat specifications.

<table>

</tbody>
</table>

(approximate figures)

(Mattern, March, 1984)
In addition to increased production of wheat products, "by 1990, China plans to produce 18 mmt of meat." Among the factors necessary to achieve that goal is "the substantial import of feed grain and protein meal." (China World Agricultural Regional Supplement; USDA, 1982, p. 1)

(IV) Global Wheat Situation

An assessment of the global wheat situation as grounded in China's need for wheat, willingness to trade with the U.S. and relevant Chinese cultural characteristics, is assumed to be a necessary consideration of a wheat negotiation between representatives of the U.S. and China. Key factors relevant to the global wheat picture are: (A) estimates of quantities available; (B) quality comparisons; and, (C) price comparisons.

(A) Quantities Available

The USDA Wheat Outlook and Situation Report states that "global wheat production has expanded each of the last five years . . . 1983 was a record global wheat harvest year." (November, 1983, p. 3)
The problem of production expansion contributing to the "world wheat glut" continues in 1984-85.

Major wheat producing countries that are contending for the Chinese market include Argentina, Australia, Canada, and the U.S. The following percentages illustrate the ratio of wheat imported by China in relation to the amount of wheat available for export within each of these countries in 1983:

- Argentina: 23%
- Australia: 10%
- Canada: 19%
- U.S.: 11%

According to Stoddard, President of Nebraska-Wyoming Wheat Growers' Association, "Even with the Soviet Union's large purchase of grain in 1984-85, the world's wheat surplus is expected to remain at about 1.4 billion bushels" (104.1 mmt) (Warneke, Omaha World-Herald Bureau, Washington D.C.; October, 1984). (Wheat Outlook and Situation Report, November, 1983, p. 2; the following tables, pp. 23 and 28, respectively)

B) Quality Comparisons

Quality comparisons of wheat exports among the four noted wheat producing countries require educated guesswork. According to a crop bulletin issued by the Canadian Grain Commission "varying standards and techniques [for wheat quality measurement] are utilized among wheat exporting countries."

(Crop Bulletin No. 159; January, 1984, p. 2)

This bulletin notes that standards and measurement techniques are similar between the U.S. and Canada (1984, p. 2).

Generally, wheat is classified according to:

(1) variety, and

Examples include: durham, hard red
Within each classification category, depending upon the availability and degree of sophistication of technical equipment, specific characteristics of wheat samples can be measured. Examples include: pasta, loaves, buns, noodles, cookies, and cakes (Agricultural Handbook; USDA, 1983, p. 3).

Included among specifications of wheat are:

- protein content %
- test weight kg
- vitreous kernals %
- vulgar kernals %
- ash %
- sedimentation ml
- moisture %

(Crop Bulletin No. 159; Grain Research Lab., Canadian Grain Commission, January, 1984)

According to Mattern, "China mills two standards of flour: 'special', and 'standard.'" An estimated quality comparison of these two categories include the following characteristics:
Variables affecting wheat prices may include:

(1) quantities available,

According to R. Stoddard, President of Nebraska-Wyoming Wheat Growers' Association, "a sustained glut of wheat in 1984-85 continues to depress market prices" (Warneke, Omaha World-Herald Bureau; Washington D.C.; October, 1984).

(2) quality classifications,

The table below represents comparative estimated costs of a sampling of U.S. wheat per variety/quality classification system.

(Mattern, 1983, p. 12)

Mattern noted that "less than 5% of total flour production in China is 'special,' and is presently available only to hotels catering to foreign currency" (1983, p. 1).
(U.S. dollars per mt)

Gulf: #1 HRW $157.

Gulf: #1 SRW $142.

Portland: #2 Western White $157.

(Source: Grain Market News, Agricultural Marketing Service, as reported in Wheat Outlook and Situation Report; November, 1983)

(3) shipping factors, and

Shipping options include:
cost and freight (C&F);
cost, insurance, and freight (CIF);
and free on board (FOB).

"Commodities imported by China are usually shipped FOB. The buying party is responsible for shipping the cargo and for paying the insurance premium, while the selling party is responsible for loading the cargo on board" (Zhao, 1984, p. 78).

(4) storage factors.

According to a merchandiser at Scoular Grain Company, standard wheat storage price is $.03 per bushel per month. At 36.73 bu per mt, the cost converts to $1.10 per mt per month.

The grain merchandiser noted that "large grain companies
have export houses on the ports--allowing them to buy large quantities of stock which may minimize storage costs" (James Grant, Merchandiser, Scoular Grain Company, March 29, 1984).

In addition, "the strength of the U.S. dollar is going to continue to affect 1984-85 wheat prices," according to Amstutz, Undersecretary of Agriculture for International Affairs and Commodity Programs, USDA.

The USDA World Agricultural Outlook and Situation Report reports that "China is willing to buy from the lowest price suppliers as long as some diversity of supply is maintained."

Mattern noted that "China is a 'price buyer,' and thus has traditionally purchased SRW (lesser quality) from the U.S. . . . China considers that it cannot afford the luxury of quality wheats . . ." (1983, p. 6).

"Low prices offered by other wheat suppliers have . . . contributed to a
lessening of China's imports of U.S. wheat this year (1983)."

For example, "Argentina is offering China price discounts in order to sell large wheat crops . . . replacing some U.S. sales . . . ." (World Agricultural Outlook and Situation Report; USDA, 1983, p. 10).

Canadian agricultural researcher, Kostecki, stated that "on the average . . . prices paid by China for Canadian grain tend to be lower than the price paid by other major buyers . . . due to quality of wheat and terms of transaction" (1982, p. 182).

The table below illustrates a cost comparison of global market prices (not specifically a China contract) in September, 1983, for comparable qualities of wheat available among the four noted countries.

<table>

</tbody>
</table>

(World Agricultural Outlook and Situation Report; USDA, December, 1983)
However, director of the Nebraska Wheat Board (NWB) reports that generally "U.S. wheat is consistently priced below its competitors. . . . U.S. export wheat prices were from $1 to $17 per ton below its competitors during the last 12 month period."

(Warneke, Farm Writer, Omaha World-Herald; February, 1984)

Figures published by the USDA (Economic Research Branch) seem to support NWB Director's statement.

Export Wheat Prices
(All in U.S. dollars per metric ton)

(V) Immediate Context

The immediate context of a wheat negotiation between representatives of the U.S. and China is grounded in the foregoing generic factors relevant to the negotiation
situation. Components of the immediate context include: (A) preliminary correspondence, (B) initial contact, (C) negotiation personnel, and (D) agenda considerations.

(A) Preliminary Correspondence

According to Buxbaum, et al., China trade specialists, "negotiation meetings with the Chinese begin with a written proposal from the U.S. company." (1982, p. 38)

Buxbaum, et al., noted that the proposal should be sent to the Foreign Trade Corporation; should include background information and sample or description of the quality of the product; and should include at least 20 copies with all materials translated to Chinese.

Buxbaum, et al., also indicated that "the Chinese are typically slow to respond to a proposal . . . sometimes making it necessary to follow-up with a second contact" (1982, p. 318).

After receiving the proposal, if interested, Chinese officials "will usually respond with an invitation to Beijing." (Buxbaum, et al., 1982, p. 323)
According to Pye, the Chinese seem to expect that the "American businessman must follow the historical practice of being the foreigner who comes as a guest seeking . . . to do business in China" (1982, p. 7).

Pye also noted that "frequently foreign businessmen experience an uncertain wait between initial communication and the granting of a Chinese visa" (1982, p. 7).

(B) Initial Contact

According to Rae, author of "Talking Business in China," upon arrival in Beijing "the first meeting will take place in the hotel room . . . concerning arrangements for forthcoming talks." (China Quarterly, June, 1982, p. 227)

As noted in the preceding outline section I/B/1, "during the preliminary stages of negotiation . . . much stress is given to the idea of friendship" (Pye, 1982, p. 31).

"Thereafter," according to Rae, "contact with the Chinese negotiators may continue daily." (1982, p. 227)
Buxbaum, et al., noted that "negotiations will last several sessions . . . from a few days to a few weeks."

(C) Negotiation Personnel

According to Tung, U.S. and China negotiation researcher, members of a U.S. company's negotiating group might include: a chief executive officer of the company, a technical specialist, a marketing representative, and a bilingualist.

Tung observed that members of the Chinese negotiating group are likely to include: "a member of the China Foreign Ministry, a member of the China Council for the Promotion of International Trade, a

Tung's research focuses on trade negotiations in general. Membership of a wheat negotiation team may not necessarily fit this pattern.

Tung also notes, "Companies with individuals that had engaged in previous negotiations with Chinese showed a significantly higher incidence of success in obtaining trade agreements" (1982, p. 27).
high-ranking Chinese Communist Party official, Chinese Party members."

According to Pye, "technical personnel or end-user representatives may be included."

Pye noted that "the Chinese negotiation team is almost always larger than the American team of negotiators" (p. 53).

Lall took note of the background training of the average Chinese party member negotiator. "A party member's four part education includes emphasis on professional training, political training, cultural training, and theoretical training grounded in the Marxist-Lennist Doctrine" (1968, p. 5).

"It is often hard to tell the functions of the members of the Chinese team," Pye noted, "and even more difficult to determine exactly where the team leader belongs in the heirachy of the Chinese bureaucracy."

Pye observed that "lines of authority can be diffused and vague. . . . Chinese negotiators often seem unsure not only of their mandates but also of the"
probable decisions of their superiors; therefore, they may inaccurately signal the state of progress of the negotiations . . ." (1982, p. xi).

However, H. Lange, Deputy Director for Economic Affairs for the State Department's Office of China Affairs, stated that Chinese negotiators have "a much wider range of discretion than they used to in dealing with foreign businessmen" (Quinlin, Omaha World-Herald Bureau, January, 1984).

Rae, negotiation researcher, indicated that "most all U.S./Chinese negotiation exchanges are made through interpreters with very few exceptions. . . ."

Authors Rae (1982), Pye (1982), Buxbaum, et al. (1982), Tung (1982), and Lange (1984) seem to share general agreement that interpreters serve a paramount function during negotiations.

Rae continued: "This . . . often causes problems as some of the Chinese interpreters provided do not fully understand colloquial English and . . . are loath to admit it" (1982, p. 276).
For example, according to Buxbaum, et al., "an effective interpreter must be knowledgeable about the style and nuances of modern Chinese usage." (1982, p. 319)

Pye seemed to agree when he noted, "many nuances are missed. . . . Remarks will be taken into account, but clues about Chinese assumptions and misunderstandings are often lost."

Japanese trade analyst, Kawasaki, has observed that "the Chinese often express their serious interest with a 'soft' [implied contextual meaning: "subtle"] expression" (1970, p. 15).

Rae's study discovered that, "U.S. firms that have Chinese speakers on the staff spend half as much time in negotiation" (1983, p. 276).

According to Pye, "An early signal of the intensity of Chinese interest in doing business, is the caliber of Chinese interpreter assigned to their sessions. Because the Chinese are short of qualified interpreters . . . assigning a superior person is a fairly reliable indication . . ." (1982, p. 53).
(D) Agenda Considerations

Factors surrounding agenda setting may be relevant considerations within the immediate context. According to Zhao, a Chinese author on Chinese export-import procedure, "the Chinese Foreign Ministry issues an annual Export-Import Management Plan which serves as a guide to Chinese negotiating officials."

"The Export-Import Management Plan is a comprehensive arrangement for certain commodities during a given period of time. It is drawn up in light of the state's foreign policy and its overall export-import plan . . ." (1982, p. 66).

(1982, p. 66)

Suggested commodity negotiation agenda items include consideration of: "quality, quantity, price, packaging, insurance, shipment, and credit."

(1982, p. 68)

According to Zhao, "the Chinese negotiator
should first seek answers to these questions:

Have we grasped the situation of the foreign market?

What are our business relations with the foreign company?

Did we confirm with the departments the quality specifications and delivery date of commodities to be imported" (1982, p. 67)?

According to Pye, "the Chinese negotiator tends to concentrate on two variables: unit price and base interest. They seem less impressed with tradeoffs among speed of delivery, extent of service arrangements, volume discounts, or cost/effectiveness of capital outlay considerations." (1982, p. 58)

Generally, scholars of Chinese negotiations agree that "the Bank of China remains the final arbiter of all Chinese buying abroad." (Rae, 1982, p. 274)

According to Pye, "overall, the Bank of China continues to exercise the allocating of exchange, monitoring resources, receiving payment, guaranteeing transaction, etc." (1982, p. 15).
Explication of the Choice-Sharing and Choice-Restricting
Communication Model

Before constructing a realistic dialog representing the two contrasting approaches of the Darnell and Brockriede model introduced in Chapter I, it was necessary to determine the relevance of each of the seven dimensions of that model:

1. Seeing other as person ---- Seeing other as object or victim
2. Win/win or lose/lose ------------------- Win/lose
3. Cooperative aim ---------------------- Competitive aim
4. Power parity -------------------------- Maintain or gain power
5. Share the choice ---------------------- Restrict the choice
6. Risk change -------------------------- Risk stagnation
7. Bilateral view of relation ----------- Unilateral view of relation

Two of these seven dimensions are inapplicable for a realistic negotiation. If the Chinese put a high priority on the preliminary time spent building friendship with negotiators (Pye, 1982; I/B/1), then it would be incompatible with that perspective for a U.S. negotiator to attribute to the Chinese the extreme of dimension #1--"seeing other as object or victim." Likewise, the extreme of dimension #7--a "unilateral view of relation"--is a contradiction of "negotiation" as defined in the context of this research. All of the remaining dimensions, numbered to correspond with the model above, are more or less applicable. The key terms and quotations in these numbered items were provided by Darnell and Brockriede (1976, pp. 21-22).

(2) Win/Win or Lose/Lose versus Win/Lose

Goals of the negotiation relationship are pertinent. "Persons
have equivalent goals when the only way a person can win is if any other person in the relationship also wins, and the only way person A can lose is if person B also loses. The contradictory goal relationship implies that the only way one person can win is if the other person loses."

(3) **Cooperative Aim versus Competitive Aim**

If negotiators have equivalent goals, they are more likely to have cooperative aims instead of competitive aims. "When two persons have an equivalent goal relationship (win/win or lose/lose), such persons will probably cooperate with each other. Persons who have contradictory goals (win/lose) will have a strong motivation to compete."

(4) **Power Parity versus Maintain or Gain Power**

This dimension "distinguishes persons who want to try to achieve relative power parity from those who don't. . . . When commonalties are many and significant and when each person wants to grant peerhood to the other, two persons can relate in complementary ways, they can give each other an opportunity to shine, they can recognize that although person A is better, stronger, more experienced, or wiser in one way, B is superior to A in others, and they can above all grant parity to the other person as person. When goals are contradictory and motivations are based on competition, the more likely outcome is for both persons to seek to maintain whatever power advantage they may fancy they have, . . . to try to capitalize on one's strengths and exploit the weaknesses of the other."
(5) **Share the Choice** versus **Restrict the Choice**

"Human beings have degrees of freedom of choices within the constraints of physical and social environmental forces. . . . We can choose to make choices on the basis of the best information and reasoning available. . . . Choices can be shared equitably . . . or choices can be restricted by coercion or by providing another person only with the illusion of choice." The negotiator who is sharing choices may jointly seek mutually satisfying options for agreement. The negotiator who is restricting choices may have a predetermined objective which may lead to restricting any options except those aimed toward achieving that objective.

(6) **Risk Change** versus **Risk Stagnation**

"A person cannot not risk something when relating with other persons." The choice-sharing negotiator may be willing to take risks that involve significant changes of ideas, self-conception, or relationship with the other; a choice-restricting negotiator takes the risk "someone takes when trying desperately to avoid taking risks, the risk of stagnation of ideas, of self-conception, and of interpersonal relations."

A negotiator operating with a choice-restricting approach may attempt to maximize a position by asking closed questions, or by making statements based upon (well-founded) assumptions, rather than risking some control by making inquiries that may elicit unanticipated answers.

A negotiator operating with a choice-sharing approach may be willing to risk a position of power or control by making inquiries that allow for less predictable answers to open questions.
Transition: Such is the relevance of five (out of seven) dimensions. The content of the subsequent dialog section is intended to illustrate the differences between sharing choices and restricting choices as negotiation strategies in a U.S. and China wheat negotiation. While the dialog illustrations are intended to represent realistic negotiation dialog, there is no reason to assume that the choices suggested in these illustrations represent actual choices.

Note: In order to facilitate cross referencing between the dialog section and the preceding pages of Chapter II, corresponding outline symbols are used.

The Chinese (CH.) dialog is presented in my words as if from the point of view of the Chinese negotiators.8

8This method of presentation is analogous to what Wendell Johnson (1946) referred to as "ventriloquizing;" speaking as if with the voice of another.
Immediate Negotiation Situation

The first dialog illustration occurs in the initial stages of negotiation. A five-member team of U.S. negotiators arrived in Beijing six days ago. U.S. team members include: a company executive, company accountant, wheat quality expert, marketing analyst, and translator (Tung, 1982: V/C). During the six days they have been attending banquets, seeing the sights, and becoming acquainted with their Chinese hosts (Pye, 1982; I/B/1).

This U.S. grain company has negotiated previous wheat agreements with the Chinese; so the team is familiar with the necessary procedure. The U.S. negotiators' visit to Beijing has been preceded by (1) correspondence introducing a 1984 wheat offer, (2) a response of interest from Chinese government officials, and (3) finalization of approximate meeting dates, hotel accommodations, visas, etc. (Buxbaum, et al., 1982; V/A).

There are eight members of the Chinese negotiating group representing various positions within the Chinese government including: a Foreign Ministry official, a member of the China Council for Promotion of International Trade, and additional Party members (one of whom is a translator) (Tung, 1982; V/C). These individuals have hosted the American visitors with genuine warmth and hospitality. Now it is time to get down to business...

Choice-Restricting
Our negotiation efforts are aimed toward a way that can help with that problem... We're willing to negotiate an arrangement whereby we could ship the purchased amount--at previously mentioned quality/quantity ratio and price--over a one year period of time, which would not only save you interest and storage costs on the unshipped balance, but would give you time to accumulate foreign exchange capital. Although
Choice-Sharing  
problem of China's foreign exchange shortage be eased by the shipment of wheat at regular intervals over a one year time period, with payment due upon receipt of each shipment? This option may offer storage facility advantages ... with probable costs comparable to storage costs in Chinese ports.

Explanation and Documentation  
search for equivalent goals. may represent contradictory goals ... competitive orientation. According to Whalen, Canada's agricultural minister, "China loses half of the food it raises" because of inadequate storage facilities (Global Outlook, Farm Journal; February, 1984). The storage aspect of this offer may be more significant from the Chinese point of view than is acknowledged at this point.

Choice-Restricting  
the purchase price for this kind of arrangement would include additional storage costs, the costs would probably be comparable to storage costs in Chinese ports. Furthermore, our company is working toward creating more awareness in the U.S. which may eventually affect U.S. law-makers' decisions about textile restrictions.

General discussions continue in both examples of dialog. The Chinese negotiators do not reveal their degree of interest in the proposals being discussed in either of the dialog examples (Pye, 1982; Samovar & Porter, 1976; I/B/3). Within each of the dialog segments, The U.S. negotiation spokesperson inquires about whether the Chinese negotiators would be interested in an informative presentation to be
given by the U.S. wheat quality expert. The U.S. spokesperson explains that the presentation would focus on wheat specifications desirable for (1) mechanized bun or loaf production, and (2) maximum nutritional benefits. The Chinese negotiators respond favorably to the suggestion. The U.S. wheat specialist proceeds to explain, by way of visual comparisons, the similarities and differences between (1) higher quality wheat and corresponding end products, and (2) lower quality wheat and corresponding end products. Previously prepared charts, diagrams, etc., written in both English and Chinese, are used to illustrate the contrasting wheat content specifications. Ample time is allowed for clarification of questions and subsequent discussions.

The Chinese negotiators seem to be more impressed with the end products made from the higher quality wheat than the products made from wheat of lesser quality. For example, the high quality bun sample is characterized by (1) lighter color, (2) more uniform texture, (3) preferable crumb properties, and (4) higher nutritional content specifications than is the bun made from lower quality wheat. The expert explains that included among other specifications necessary for such quality is a designated percentage range of protein and ash relative to moisture content (Mattern, 1984; III/B/2).

Although China has previously been unwilling to purchase any notable quantity of HQS wheat because they "can't afford the luxury of quality wheat" (Mattern, 1983, p. 6; IV/C/4), they continue to express

---

9In the context of this study, the higher quality wheat will hereafter be referred to as HQS (higher quality specification) wheat. Lower quality wheat will hereafter be referred to as LQS (lower quality specification) wheat.
an interest in both mechanized bread production and nutritional improvements that require a higher quality grade of wheat (Mattern, 1983; III/B/2).

With those perceptions in mind, in each example, the U.S. negotiator proceeds accordingly:

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>U.S.: Our company is interested in helping China achieve the goal of increased bun or loaf (automated) bread production. We have considered some terms of mutual benefit that may expedite your efforts toward reaching that goal.</td>
<td>U.S.: (Same as left column)</td>
<td></td>
</tr>
</tbody>
</table>

Discussions, which serve to clarify understanding of U.S. proposals in relationship to China's needs, continue in each dialog example. In each case, negotiators from the U.S. company are attempting to persuade the Chinese to purchase a portion of HQS wheat in relationship to the total wheat purchase. The Chinese negotiators methodically examine what they seemingly perceive to be all relevant information.

In both the choice-sharing and choice-restricting dialog examples, specific items for agreement have been introduced by the U.S. negotiators during the foregoing discussions.

</tr>
</tbody>
</table>
The Chinese negotiators may respond to either the choice-sharing or choice-restricting offers in numerous ways depending upon which combination of options they choose to accept, reject, or attempt to modify at this stage of negotiations.

In turn, the U.S. negotiators' follow-up response, for either the choice-sharing or choice-restricting examples, will depend upon the Chinese negotiators' acknowledged choices at this time. For example:

If the Chinese negotiators agree to consider:

<table>

</tbody>
</table>
CH.: As we review your offer in light of our wheat needs and financial limitations at this time, we recognize that the maximum amount of wheat we are willing to consider for this purchase is .75 mmt (750,000 mt). We are, however, interested in a portion of bunt or loaf quality wheat and are considering a 50% ratio of HQS wheat depending upon the discount you are prepared to make available for such a purchase. We have determined that we cannot accept any less than $2.00 per mt discount off the established market price for either HQS or LQS quality ranges.

Although we appreciate your interest in our technical development related to wheat processing, we cannot, at this time, consider any commitment regarding future purchases of HQS wheat.

While final authorization of this purchase may ultimately depend upon the suggested long-term shipping arrangements, we are not prepared to pay the cost of storage on the unshipped balance of wheat at this time.

<td></td>
<td></td>
</tr>
</tbody>
</table>

If discussions continue in each dialog example, and if no new information is introduced, then at the end of this series of negotiation meetings, the U.S. and Chinese negotiators might reach a general--but provisional--agreement:
**Choice-Sharing General Provisional Agreement**

China tentatively agreed to purchase 1 mmt of wheat. An unspecified portion up to 50% of the total purchase, would be HQS wheat; the remaining portion, LQS wheat. The minimum price discount per mt (because of smaller total quantity) will be $1.25 - $1.50 off the prevailing market price per mt... additional discount considerations to be negotiated in subsequent meetings. Each party agrees to continue negotiating options which may allow for the mutually

This offer vs. leaves room for flexibility... less specific.

This offer seems to be more "aggressive", "competitive"... more specific.

**Choice-Restricting General Provisional Agreement**

China tentatively agreed to purchase a maximum 1 mmt of wheat instead of 1.5 mmt previously stated. They agree to purchase up to 50% HQS wheat only if subsequent price discussions meet adequate discount expectations; to be no less than $1.75 less per mt of the existing market price for either quality.

According to the Chinese negotiators, the financial feasibility of this wheat deal may depend upon the long-range shipping arrangements. Both parties agree to continue
<table>
<thead>

</thead>
</table>
| advantageous long-term shipping arrangement. Chinese negotiators state that at this time they are unable to consider U.S. technology offers which would require an exchange agreement of future HQS wheat purchases. However, they remain interested in the U.S. offer—particularly the 'prototype bakery.
| Ignores "future agreement" trade-off which may imply a greater U.S. interest in immediate gain. See Table 2: "Provisional General Agreement."

In each dialog example, the Chinese spokesperson indicates the need for an unspecified amount of time during which the Chinese negotiators will seek necessary authorization (from government officials not present at these meetings) for specific issues of agreement (Pye, 1982). U.S. negotiators realize from previous experience that negotiations in China may take an unpredictable amount of time. They are not surprised that eight days pass before they receive notification for meetings to resume (Buxbaum, et al., 1982; I/B/1).

When the next session begins, social amenities are exchanged followed by a lengthy recapitulation

however, assuming the Chinese negotiators remain interested in technical assistance with wheat processing; then the U.S. negotiators might respond as follows:

**Choice-Sharing**  
U.S.: We recognize that your first large volume purchase of HQS wheat may need to be less than 50% in order to allow for most efficient utilization of such quality. It may be advantageous for both the U.S. and China to look more closely at long-range considerations which would allow for a gradual increase in HQS over the next several years and assistance to

**Explanation and Documentation**  
See Table 3: "U.S. Follow-up."

**Choice-Restricting**  
U.S.: We must stress that the reason for the economy discount on HQS was due to availability of large volume. Any amount less than .5 mmt HQS immediately decreases the volume advantages and therefore, increases our cost.

We could sell you a 30% portion of HQS but at the previously specified price per mt, we could justify nothing more than a 20% storage discount. Any considerations of

price discount, and
(2) available storage
facilities for your
unshipped wheat at
an economical price.

Given the number of options that the Chinese negotiators might consider for agreement, there
is no feasible way to determine how this negotiation might end. At this stage of progress, even those
negotiating cannot be certain of the outcome. It is possible, however, to speculate about any number
of outcomes that might evolve from these discussions. For example:

(1) If U.S. and Chinese negotiators reach an agreement for the sale of 50% HQS and 50% LQS whereby
choices were restricted by U.S. negotiators to the degree that the Chinese negotiators perceive that
the immediate gains for the U.S. company supersede their long-range mutual considerations for China's
efficient utilization of the higher quality wheat purchased from the company, then it is plausible
that the long-term relationship between China and the U.S. company may be threatened.

(2) If the U.S. negotiation representatives limit the most desirable options for agreement to a purchase
containing a minimum 50% HQS, then it is plausible that the Chinese may decide to purchase 100% LQS
from another source at a better price (World Agricultural Outlook and Situation Report, 1983; IV/C/4).

(3) If the U.S. negotiation representatives are unable to persuade the Chinese that in order to progress
toward their goals of improving nutrition and food variety, it is necessary to import a portion of 
HQS at a moderately higher price, yet are willing to offer options which allow a sufficiently competitive 
price for LQS quality wheat, then the U.S. company and China may arrive at a mutually beneficial agreement 
similar to last year's sale of 100% LQS quality wheat. Although no HQS sale is made in these 
circumstances, negotiation discussions regarding utilization of higher quality wheat serve to heighten 
Chinese awareness which may lead to future HQS sales.

(4) If the U.S. and Chinese negotiators jointly work toward equitable goals while searching for a 
mutually beneficial combination of options among a repertoire of options, then the U.S. and Chinese 
negotiators may reach an agreement whereby: (a) a portion of the total sale is HQS wheat, (b) the 
U.S. company agrees to assist and advise in the construction of a mechanized bakery in Beijing, and 
(c) China agrees to purchase some (minimum specified amount) HQS quality wheat over the next three-
year period. The U.S. company may have sacrificed a large immediate profit on HQS wheat but gained 
long-range market advantages. (See Table 5)

Chapter III

AN OUTLINE OF CONSIDERATIONS FOR COLLECTING POTENTIALLY USEFUL NEGOTIATION DATA; CAPABILITIES NEEDED TO SUPPLY DATA

The next step in the research design is to analyze—from a communication perspective—the contrasting negotiation dialogs in Chapter II. What information might competent U.S. negotiators need in order to generate effective communication strategies in this negotiation context?

A way negotiators can determine potentially useful information is to construct an outline of considerations relative to the particular situation. An outline of considerations may be more usefully understood if viewed as matrices—or forms ready to receive data. The matrices are constructed by generating relevant questions grounded in three integrated points of view: (1) argumentation theory; (2) intelligence gathering processes; and (3) win/win orientation. The following outline of matrices is patterned after the outline in Chapter II.

As I generated the questions within each matrix, complexes of capabilities for answering the questions emerged. I grouped each set of capabilities into corresponding categories of expertise. Each set of questions is labeled in the left-hand column according to the expertise needed to supply answers. Expertise required to supply data within one matrix may overlap with expertise needed in another. Sublabels (typed lower case letters and sometimes in parentheses) serve to indicate a potential need for more than one category of expertise within any given set of questions.
The section of Chapter III which describes the capabilities needed to supply data begins on page 151.

Outline of Matrices

- CHINESE CULTURE
- INTELLIGENCE

(I) Relevant Chinese Cultural Factors
What are Chinese cultural factors that may be relevant for this wheat negotiation?

(A) Ambivalence Toward Westerners
How might the characteristic of the Chinese disposition toward Westerners affect this negotiation situation?

What Chinese attitudes might exist toward America? Toward American representatives at a wheat negotiation?
Toward America in relation to Chinese attitudes toward other MWEC?

(B) Negotiation Orientation
What might be the general Chinese negotiation orientation?
How can we adapt our strategy to be compatible with the potential Chinese negotiation orientation?

(1) Friendship Value
How, for instance, can we most effectively respond to the apparent Chinese value on friendship in a way that will
demonstrate our sincerity and trustworthiness to the Chinese negotiators?

(2) General to Specific
How can we most effectively arrange the items for discussion during negotiation meetings in order to achieve maximum efficiency from our point of view, yet remain compatible with the apparent Chinese orientation of negotiating general items first, leaving specific details until later? At what stage of negotiations can we begin to initiate "getting specific" without offending Chinese negotiators?

(3) Ambiguity and Contradiction
What steps can we take to minimize misunderstanding, ambiguity and contradiction?
What choices of words, phrases, examples, illustrations, or other methods of communication might be effective from the Chinese point of view as we attempt to recreate meanings? To search for mutually acceptable solutions? To provide good reasons for our arguments?
(4) **On-going Relationships**

How might we encourage an on-going relationship with the Chinese that would be mutually beneficial as perceived by the Chinese negotiators? What choices might be available? Feasible? Practicable?

(II) **China's Willingness to Trade with U.S.**

What factors might affect China's willingness to trade with the U.S.?

(A) **Financial and Trade Issues**

How might financial and trade issues affect China's willingness to buy U.S. wheat?

(1) **Trade Inequity: Imports Relative to Exports**

What are current and historical factors surrounding U.S./China trade relations compared to trade relations between China and other MWEC?

Factors might include:

(a) Balance of trade figures?

(b) Products and amounts imported by China from each MWEC?

(c) Products and amounts exported by China to each of MWEC?

(d) Apparent degree of Chinese satisfaction in each case?
What steps, if any, may be advisable for our company to take within the U.S.'s legal, political, or social systems toward resolving problems related to U.S. textile import-restriction laws? How might such steps be perceived by the Chinese?

(2) Economic Status

What is the current economic status of the U.S. compared to each of the MWEC? In each case, how might the economic status of each MWEC affect that country's:

(a) Available wheat?
(b) Wheat prices?
(c) Stability of a wheat contract?
(d) Potential long-term relationship with China?

How might the economic status of each MWEC affect China's willingness to negotiate with that country as compared with negotiating with the U.S.?

(3) Currency Value

What is the value of the Chinese monetary unit in relation to the
value of the monetary unit of each MWEC? What is the trend of U.S. dollar values? How is that trend likely to affect not only China's buying power, but also their willingness to buy from the U.S. versus the other MWEC?

(4) Trade Impact

What impact are U.S./China trade relations likely to have on China's willingness to buy U.S. wheat at this time? Ditto for the other factors that may affect China's willingness to buy U.S. wheat?

How will an assessment of financial and trade issues affect our overall negotiation strategy? Affect the formulations of arguments that might "make sense" to the Chinese negotiators? Aspects of formulations such as:

(a) What to address?
(b) What to avoid?
(c) Timing?

(B) Political and Diplomatic Relations

How might political and diplomatic relations affect China's willingness to buy U.S. wheat?
(1) Current and Historical Relations
What are the current and historical factors surrounding U.S./China diplomatic relations as compared to relations between China and other MWEC?

(2) Priority Issues
What are priority issues from the Chinese point of review related to U.S./China diplomatic relations? What steps, if any, may be advisable for our company to take within the U.S.'s legal, political, or social systems toward resolving potential problems? How might such steps be perceived by the Chinese?

(3) Relationship Impact
How might the Chinese perceptions of U.S./China diplomatic status in relations to China's diplomatic status with other MWEC affect these Chinese negotiators' willingness to buy U.S. wheat at this time? Ditto in relation to other factors that may affect China's willingness to buy U.S. wheat? How might an assessment of political
and diplomatic issues affect our overall negotiation strategy? Affect formulations of arguments that might "make sense" to the Chinese negotiators?

Aspects of formulations such as:
(a) What to address?
(b) What to avoid?
(c) Timing?

China's Interest in U.S. Technology

How might China's interest in U.S. technology affect her willingness to buy U.S. wheat?

Modernization Goals

How serious is China about achieving modernization goals?

What portion of China's annual budget for each of the last ten years was spent on technology acquisition?

Considerations to include:
(a) Types of technology?
(b) Technological priorities?
(c) Quantities?
(d) Sources of acquisition?

Domestic research?

Importation? If so, from whom? When? Under what circumstances?

What did China budget for general technology acquisition? How might
we key into China's actual and potential technology interests as we formulate offers acceptable from the Chinese point of view?

(2) Wheat-Related Technology

What portion of China's total annual budget for each of the last ten years was spent on wheat-related technology acquisition?

Considerations to include:
(a) Specific types of technology?
(b) Priorities?
(c) Quantities?
(d) Sources of acquisition?

Domestic research?

Importation? If so, from whom?
When? Under what circumstances?

What did China budget for wheat-related technology acquisition? Does China's interest in wheat-related technology warrant considerations of a wheat-related technological offer to be included in the wheat negotiation? What are plausible Chinese priorities?

How feasible are such considerations from our point of view? From the
Chinese point of view? Feasibility considerations include:
(a) Construction costs?
(b) Operational costs?
(c) Technical training?
(d) Long-range practicability?
What range of choices regarding wheat-related technology might be feasible during this negotiation?

(3) Technological Impact
How might China's interest in U.S. technology in general, or wheat-related technology in particular, affect its willingness to buy U.S. wheat?
Wheat from our company? Ditto in relation to other factors that may influence willingness to buy U.S. wheat?
How might an assessment of China's interest in U.S. technology affect our overall negotiation strategy?
At what stage during negotiations might it be most effective to introduce a range of plausible technology options versus what stage it would be most effective to limit technological options? Under what circumstances?
(III) China's Need for Wheat

How much wheat does China need to import?

(A) Supply

What factors are affecting China's wheat supply?

(1) Crop Yield

What is China's current wheat yield in relation to each of the ten preceding years?
Anticipated wheat yields?
Considerations to include:
(a) Quantity?
(b) Quality?

(2) Influencing Factors

What factors influence China's wheat yield for each of the assessed years?
Factors such as:
(a) Weather?
(b) Land base?

   Amount of tillable land?
   Quality of tillable land?
(c) Modernization programs?
What are current and proposed modernization efforts related to wheat production?
What present and anticipated proportion of China's national budget is designated for "modernization" of wheat production? Which aspects of "modernization" are targeted? Mechanization? Fertilization? Pest control? Work incentive plans? Other aspects targeted? What is the current and projected effectiveness of the wheat production modernization programs as measured by production of output (both quantity and quality) relative to input?

(3) Wheat Importation

What is China's current level of wheat importation relative to past levels? Relative to anticipated levels? (a) Quantity levels? (b) Quality levels? What factors affect these importation levels?
(B) Utilization

What is the status of wheat utilization in China?

(1) Consumption

What is the current wheat consumption in China in relation to both the preceding ten years and the next five to ten years?

Considerations to include:
(a) Quantities?
(b) Quality of wheat ratios?

(2) Influencing Factors

What factors influence China's wheat consumption patterns? Factors such as:

(a) Living Standards?

What are present and anticipated standards of living in relation to previous years? What factors may contribute to changes in living standards?

(b) Population Growth?

What is the current population of China relative to both past and projected growth rates?

What combination(s) of factors
provide the most plausible explanation of China's population growth rate? How effective are China's population-control programs?

(c) Nutrition and Diet-Variety?

How might China's nutrition and diet-variety policies affect wheat consumption patterns in China? What are the present end-uses of wheat relative to both past and potential uses of wheat?

Considerations include:

- Amounts?
- Nutritional content?
- Wheat quantities required to reach China's production goals?
- Sources of wheat?
- Availability of end-products to Chinese consumers?

How are comparisons between units of HQS wheat and other known sources of nutrition in China perceived by the Chinese? Comparisons on factors such as:
Nutritional values?

Approximate costs:

Of production?
Of processing?
Of distributing?
Of spoilage?

Number of jobs that exist
as a result of producing,
processing, and distributing
each source of nutrition
in China?

(d) Modernization Programs?
How might the current modernization
efforts affect China's wheat
consumption patterns? What
is the degree of mechanized
wheat processing (in China)
in relation to both preceding
and subsequent years? Aspects
include:
Types of end-products?
Amounts?
Nutritional contents?
Approximate wheat quantities
required?
Approximate wheat qualities
required?
Sources of wheat?

Availability to Chinese consumer?

(C) Relationships Between Supply and Utilization

What are the relationships between factors contributing to China's utilization of wheat and China's ability to produce wheat?

(1) Wheat Needs

What is China's level of need for imported wheat this year? In subsequent years? Factors include:

(a) Quantities?

(b) Quality ratios?

Do the Chinese see a need for a portion of higher quality wheat in relation to the "ordinary" quality purchased in previous years? If so, what present and forecasted ratio of quality?

(2) Need Impact

How might an assessment of China's wheat needs affect negotiation strategies? Formulations of mutually advantageous arguments designed to persuade the Chinese negotiators?

What combinations and ranges of
choices might we share or restrict? When to share or restrict which choices? How to present choices for effective persuasion?

Global Wheat Situation

Available Wheat

What is the present wheat situation for each of the MWEC in relation to both the preceding ten years and the next five to ten years?

1. Yield Comparisons?

What are approximate wheat yield comparisons? Aspects include:
- Total amount produced?
- Amounts available for export?

2. Quality Comparisons?

What are approximate quality comparisons? Aspects include:
- Content specifications?
- Variety?

3. Price Comparisons?

What are approximate export price comparisons among MWEC for comparable content specifications and variety?
(4) **Influencing Factors**?

What factors might affect the quantity, quality, and price variables for each MWEC in relation to the global wheat market picture?

(B) **Transportation Options**

What wheat transportation options are both available and advisable for our company to use in relation to options used by other wheat exporters?

Aspects to consider include:

(1) **Combinations** of transportation methods?

(2) Costs?

(3) Size of shipments?

(4) Insurance?

What transportation options have been used in the past for wheat shipments to China from the U.S. and other MWEC?

What was the degree of Chinese satisfaction?

(C) **Storage Options**

What U.S. wheat storage options are both available and advisable for our company to use in relation to options used by other wheat exporters?

Aspects to consider include:

(1) Storage availability?

   Home-port facilities?

   Chinese-port facilities?
GLOBAL WHEAT MARKET

INTELLIGENCE

(2) Storage capacity?
(3) Storage adequacy (spoilage)?

What storage options have been used for previous Chinese wheat purchases from MWEC? What are plausible terms of negotiation contracts?

(D) Previous or Pending Wheat Contracts

What wheat deals have been made or are pending between China and other U.S. companies and MWEC?

What are plausible terms of negotiation contracts?

Aspects to include:
(1) Quantities?
(2) Quality ratios?
(3) Approximate prices?
(4) Shipping options?
(5) Storage factors?

Are the Chinese apparently satisfied?

What is the potential for long-term contract relationships?

Wheat

(E) China's Wheat Standards

What are China's (1) wheat quality standards, and (2) quality measurement techniques, relative to standards and measurement techniques used by MWEC? What are the
potential problems related to variations in standards or measurement techniques?

Are new varieties of wheat available that may be well suited to China's needs?

**Global Wheat Impact**

How might an assessment of the global wheat situation affect overall negotiation strategies? Formulations of mutually advantageous arguments designed to persuade Chinese negotiators? What combinations and ranges of choices might we share or restrict?

Among factors to consider:

1. Quantity?
2. Quality?
3. Price?
4. Storage?
5. Shipping?

When to share or restrict which choices?

How to present choices for effective persuasion?

**Immediate Context**

What are factors to consider within the immediate context?

**Preliminary Contact**

How do we most effectively introduce a
wheat proposal by way of initial correspondence?
Considerations include:
(1) To whom?
(2) How detailed?
(3) Number of copies?
(4) Chinese translation?
(5) Amount of time to allow for response?
What factors are likely to influence the location, frequency, and duration of negotiation meetings?
Factors may include:
(1) Chinese tradition?
(2) Chinese hospitality?
(3) Practicability?

(B) Initial Contact

What do we know about these particular Chinese negotiators?
Considerations might include:
(1) Background?
(2) Experience negotiating in general, or with Americans?
(3) Level of autonomy within government hierarchy?
(4) Ability to speak and understand English?

(C) Negotiation Personnel

What are the qualifications needed for
U.S. team negotiators?

Considerations might include:

(1) Experience negotiating in general, or specifically with Chinese?

(2) Background in designated area of expertise?

(3) Decision-making authority?

(4) Ability to speak and understand Chinese?

What, if any, previous negotiation experiences has our company had with China?

Factors to consider may include:

(1) Terms of previous agreements?

(2) Apparent degree of Chinese satisfaction?

(3) Long-term relationship potential?

How does this negotiation situation compare with previous negotiation situations?

(1) Similarities?

(2) Differences?

How can we effectively use what we have learned?

(D) Agenda

What is a plausible Chinese agenda for this negotiation?

Aspects might include:

(1) Priority of items?

(2) Current Chinese policies (e.g., China's Import/Export Plan) that may have an effect on the administration of a wheat contract?
What are current financial transactions between the Bank of China and:

(1) U.S. traders?
(2) Other MWEC?

How large a wheat deal is the Bank of China likely to authorize with our company at this time? What factors might affect the Bank of China's authorization?

What are our assumptions related to this negotiation? What are our perceptions of the Chinese assumptions related to this negotiation? Do we want to seek win/win solutions? Have we done our homework enabling us to both create win/win solutions and avoid surprises at the negotiation table?

What are the initial calculations of cost variables as we create and rearrange combinations of negotiation options? What are the immediate and long-term financial implications for our company related to plausible negotiation options?

What is the most effective way to translate Chinese verbal and nonverbal symbols to
(VI) Dialog

The remaining questions are generated from the dialog section of Chapter II. They reflect considerations necessary for designing choice-sharing or choice-restricting strategies as needed within a win/win negotiation orientation.

(A) Choice-Sharing or Choice-Restricting Strategies

How might our goals and China's goals affect negotiation strategies?

(1) Goals

Are the U.S. and Chinese negotiation goals equivalent? Contradictory? Degrees of both? Is, for instance, a plausible Chinese goal of "buying the cheapest wheat available on the world market" likely to be compatible with a plausible U.S. goal of "selling China some portion of HQS wheat if it serves to meet China's needs?"

Is it advantageous to search for equivalent goals? If so, how? When? Under what circumstances?
(2) **Cooperation**

How can we best encourage a cooperative negotiation environment? How can we gain Chinese trust so they recognize our genuine cooperative intentions?

(3) **Power Choices**

When is it more or less advantageous to

(1) Seek power parity?
(2) Seek ways to gain and maintain power?

(4) **Share Choices or Restrict Choices**

(a) **Share Choices**

Is it advantageous to search with the Chinese negotiators for a broad range of acceptable, creative choices, by asking open questions and inviting open discussions?

If so, when? Under what circumstances? What range of choices are we prepared to make available? At what stages of negotiation? Which choices are preferable from our point of view? Which choices may be preferable from the Chinese point of view?

(b) **Restrict Choices**

Is it advantageous to restrict potential choices except those aimed toward defined objectives of this wheat
(5) Risk-taking

Is it advantageous to take some risks in order to discover plausible solutions for agreement? If so, when? Under what circumstances?

(B) Adaptation Choices

Have we adapted negotiation choices to fit the Chinese point of view?

What arguments are likely to be meaningful from the Chinese point of view?

(1) Argumentation Evidence

What evidence, and patterns for arranging evidence, may serve as sufficient substantiation from the Chinese point of view?

Considerations might include:

(a) Statistics translated to meaningful context?

(b) Expert Chinese testimony?

(c) Examples and analogies grounded in the Chinese experience?

(d) Comparative data on charts?

(2) Timing

When is it most adaptive to present which arguments?
(3) Lasting Relationship

How can we most effectively build a lasting relationship with the Chinese?

Aspects might include:

(a) Attempts to meet short-term needs?
(b) Attempts to meet long-term needs?
Complexes of Capabilities Required to Supply Unknown Data

The preceding questions—generated from a communication perspective—formed a structure of matrices for potentially useful negotiation data. As sets of questions were generated, the categories of expertise needed to answer the questions emerged. If adaptive communication strategies are to be designed and implemented, then data within each matrix must be supplied as needed by the resource capabilities among individuals selected as (1) on-the-scene negotiators, (2) negotiation planners, or (3) both. Data relevant to a wheat negotiation with the Chinese can be supplied by selected negotiation personnel who jointly provide the following complexes of capabilities: (Expertise categories appear in the order of emergence throughout the foregoing structure of matrices.)

**Chinese Culture**

Needed capabilities include:

1. Advising teammates of relevant Chinese cultural characteristics as viewed from a historical perspective. Aspects may include not only customs, but plausible beliefs, attitudes, and values.

2. Noting similarities and differences between U.S. and Chinese cultural and political patterns thereby enabling U.S. negotiators to better adapt.

---

11A broad-gauged negotiation team member might serve as a liaison between (1) "on-the-scene negotiation experts, and (2) "at home" negotiation experts (by acquiring up-to-the-minute information as needed through electronic communication systems).

12If selected team experts are to achieve an optimal level of effectiveness, they must be able to coordinate individual expertise to form team expertise. Authors Crable (1981) and Cushman and Cahn (1984) provided information relative to "team building"—maintaining effective working relationships among team members.
(3) "Seeing" relevant circumstances from a plausible Chinese point of view and sharing that insight with teammates.

(4) Advising U.S. negotiators of Chinese patterns of negotiating. In addition to cultural-related customs, aspects to consider might include: (a) plausible Chinese strategies; (b) plausible agenda; and (c) plausible contract requirements.

(5) Assessing the present and forecasted affects of China's modernization programs on the Chinese lifestyle as may be related to this wheat negotiation.

(6) Inferring a "Chinese" view of our company. Aspects might include: (a) the company's reputation in the international marketplace, (b) Chinese attitudes toward our company's efforts to change U.S. policies related to "textiles" and "Taiwan."

(7) Generating content for argument substantiation (e.g., examples and expert testimony) that will tie into a plausible Chinese experience.

**Intelligence**

Needed capabilities include:

(1) "Integrat(ing) scientific knowledge and research efforts within the larger framework of the 'system' for study . . ." (Oneill, 1964, p. 2).

(2) Interpreting interrelationships of known data as needed to make plausible inferences about data that are missing.

(3) Analyzing and synthesizing pertinent data in order to detect credibility trends for use in forecasting.

**Communication**

Needed capabilities include:

(1) Coordinating capabilities among negotiation personnel by facilitating creative group interaction needed to jointly plan negotiation strategies.

(2) Facilitating a group effort to gain and maintain perspective of the negotiation whole.

(3) Generating persuasive communication strategies adapted to the situational context.
U.S./Chinese Translation

Needed capabilities include:

(1) Interpreting verbal and nonverbal symbols of both Chinese and English languages.13

(2) Restating what was said in Chinese or English without making technical mistakes or mistakes related to culture-specific interpretations.

Chinese International Relations

Needed capabilities include:

(1) Analyzing and interpreting historical patterns of diplomatic relations between China and MWEC relative to this wheat negotiation.

(2) Analyzing and interpreting present and forecasted diplomatic relations between China and MWEC (and other countries with potential involvement) relative to this wheat negotiation.

International Economy

Needed capabilities include:

(1) Analyzing and interpreting the economic status of China and each of the MWEC in relation to the global economic picture relative to this wheat negotiation.

(2) "Translating" currency variations among each of the MWEC and China as needed.

---

13 Thomas S. Kuhn draws a crucial distinction between the ability to learn another language and the ability to translate from one language to another. "Though one must know two languages in order to translate at all, and although translation can then always be managed up to a point, it can present grave difficulties to even the most adept bilingual. He must find the best available compromises between incompatible objectives. Nuances must be preserved but not at the price of sentences so long that communication breaks down. Literalness is desirable but not if it demands introducing too many foreign words. . . . People deeply committed to both accuracy and to felicity of expression find translation painful, and some cannot do it at all." Kuhn further states a reason why languages are "untranslatable": they "cut up the world in different ways" (1970, p. 267).

Ruprecht Pague, student of history, philosophy, and languages seems to agree. He notes that "'reality' is not an 'objective' sum of facts independent from language--but that language structures reality" (1982, p. 55).
Wheat Technology

Needed capabilities include:

(1) Determining various types and costs of wheat-related technology that might have practical application in China.

(2) Analyzing various stages of U.S. wheat-related technological development as it might relate to comparable stages of Chinese technological development.

Chinese Agriculture

Needed capabilities include:

(1) Assessing current and projected agricultural production in China. Aspects might include: (a) commodities; (b) quantities; (c) qualities; (d) production costs; (e) yield factors; and (f) consumer benefits (nutrition).

(2) Assessing current and forecasted food consumption patterns in China. Aspects to include: (1) impact of nutrition and diet-variety policies on food consumption, and (2) consumption comparisons of primary food sources.

(3) Analyzing China's agricultural exports relative to imports.

(4) Assessing the overall Chinese wheat picture. Aspects should include: (a) production; (b) exportation; (c) importation; (d) processing; and (e) consumption.

Population

Needed capabilities include:

(1) Analyzing population growth in relation to food production and consumption patterns in China.

Nutrition

Needed capabilities include:

(1) Analyzing nutritional content levels of primary food sources in China.

(2) Assessing cost per unit of each food source.

(3) Assessing perishability factors related to each food source.
Global Wheat Market

Needed capabilities include:

(1) Analyzing and interpreting the present and forecasted global wheat situation. Aspects to consider include factors influencing supply and demand.

(2) Analyzing global transportation and storage options.

(3) Making inferences about existing and anticipated wheat contracts among any of the MWEC. Aspects to include terms of agreement such as: price, shipping, storage, quantity, and quality.

Wheat

Needed capabilities include:

(1) Identifying varieties and grades of wheat related to quality specifications.

(2) Identify wheat-quality specifications required for designated end-products.

(3) "Translating" a given country's wheat-quality measurement system to another country's system as needed for comparability assessments of available wheat quality.

Company

Needed capabilities include:

(1) Acquiring pertinent legal information relative to a wheat contract with the Chinese.

(2) Identifying this company's technological know-how relative to plausible negotiation proposals.

(3) Assessing long-term and short-term profit considerations relative to plausible negotiation proposals.

(4) Knowing details of previous company negotiation experiences (from which to learn) including procedural items related to: (a) shipping; (b) storage; and (c) financing considerations.

(5) Selecting competent negotiation personnel with capabilities needed in this particular negotiation situation.
Accounting

Capabilities should include:

(1) Analyzing cost feasibility factors related to plausible negotiation proposals.

(2) Forecasting costs associated with future-related proposals.

(3) Acquiring necessary financing information relative to this wheat contract.

(4) Making on-the-spot calculations and cost forecasts as needed during negotiation sessions.
Chapter IV

THE METHODOLOGY

The two preceding chapters of this study serve to illustrate early stages of preparation for a wheat negotiation between representatives of the U.S. and China. Chapter II serves to: (1) map the structure of this particular negotiation situation; and (2) illustrate the similarities and differences between choice-sharing and choice-restricting communication approaches. By generating and organizing questions, Chapter III serves to: (1) outline the structure of matrices to accommodate the potentially useful information when selected questions are answered; and (2) illustrate the complexes of capabilities required to secure those answers.

Chapter IV provides and illustrates a procedure by which negotiation teams can design their own communication strategies. The structure of the communication methodology is shown in Figure 3. For similarities and differences between this diagram and the Model for Generating a Methodology (in Chapter I) see Table 6.
(Each chapter number [Roman numerals] appears in the upper right-hand corner of the particular diagram box that represents that chapter's phase of negotiation preparation.)

**Figure 3.** Methodology for Generating Communication Strategies in the Context of a Wheat Negotiation Between Representatives of the U.S. and China.

Introduction to the Communication Methodology

The procedure for generating communication strategies entails three stages. Stage One: team negotiators utilize intelligence information in order to make credible forecasts pertaining to each set of negotiation claims. Stage Two: negotiators identify potential rhetorical obstacles that may be present in relation to each set of negotiation claims. Rhetorical obstacles may arise from (1) the Chinese disposition in this situation, (2) the subject or purpose of this negotiation, or (3) the perceived credibility of the U.S. negotiators. Stage Three: negotiators generate appropriate communication strategies which emerge as a result of a 'marriage' between stages one and two.

This methodology focuses on the invention and arrangement of relevant data in ways that may be most persuasive in the context of the particular situation. Included among the methods used for inventing and arranging negotiation strategies in the context of a wheat negotiation

14The introductory comments are based upon retroflective observations made after wheat negotiation strategies were generated by way of the communication methodology.

15Invention refers to the discovery of any available means of persuasion to include both artistic and inartistic data. Inartistic data involve the collection of factual information, statistics, statements from authorities, laws, etc. (Harper, 1979). Artistic data are in the realm of plausible reasoning, forecasts, and credibility trends. They are the product of imagination—an outcome of a creative process (see Appendix A).

16Aristotle identified the five canons of rhetoric: invention, arrangement, memory, style, and delivery. Harper (1979), approximately 2500 years later, renamed the classification system. Her classification of the five components of rhetoric may serve to further clarify the function of each. They are: conceptualization (invention), organization (arrangement), categorization (memory), symbolization (style), and operalization (delivery).
are: (1) plausible reasoning methods; (2) methods by which negotiators can gain and maintain perspective; (3) joint, creative problem-solving methods; (4) argumentation methods; and (5) methods for adapting strategies to the particular negotiation situation. Both choice-sharing and choice-restricting wheat negotiation strategies reflect the utilization of these methods.

**Plausible Reasoning Methods**

Intelligence related to each set of negotiation data is gathered by way of plausible reasoning methods. During early planning stages, negotiators accumulate relevant data and map the structure of the inter-related negotiation factors. Once the situation is mapped from known data, negotiators can identify the structure of relevant data not yet known. Some of these data can be secured from open sources. Other unknown data can be calculated mathematically. Yet another way to fill in the gaps of needed information is to make educated guesses--plausible inferences--derived from the known data. Plausible inferences are provisional. Provisional forecasts--after testing by observation--may become more or less credible over time and constitute credibility trends which are, more often than not, useful for planning negotiation strategies. Each set of negotiation factors introduced in Stage one of the strategy-generating procedure represents credibility trends derived from intelligence data gathered by plausible-reasoning methods. The credibility trends are presented as interrogatories which serve to highlight the provisional nature of plausible inferences.

---

17See Appendix A re plausible reasoning methods for gathering intelligence.
Methods by Which to Gain and Maintain Perspective

The conventional method of organizing data into supersets, sets, and subsets contributes to gaining perspective when the principle of subordination is in no way misleading. Of course, data can be grouped, and regrouped, in various ways to satisfy the requirements of accurate mapping of data in each phase of preparation. When one constellation of negotiation factors is perceived in the foreground for analysis and interpretation, the other factors remain in the background. For example, when focusing on Chinese cultural characteristics, factors related to global wheat prices, wheat quality concerns, and diplomatic relations between U.S. and China are not excluded but remain in the background. Negotiators must seek to maintain perspective as needed to fit changing circumstances.

Joint, Creative, Problem-Solving Methods

According to Nierenberg, "if we think of negotiation as a cooperative enterprise, instead of limiting choices by seeking concessions and compromise, we expand our choices by jointly seeking creative alternatives" (1973, p. 182). An underlying orientation of this methodology: "if this negotiation is successful, we all win something." The objective is to achieve agreement, not total victory. Both parties must feel they have gained.

The communication strategies in the following section reflect the notion that both sides participating in this wheat negotiation can win. Win/win strategies reflect attempts to: (1) search for common objectives, and (2) create a cooperative atmosphere whereby negotiators on both sides can generate creative solutions to negotiation
problems. For example, U.S. and Chinese negotiators may mutually determine that U.S. bakery planning assistance in China in exchange for China's purchase of a portion of HQS wheat may serve to meet the needs of both parties.

**Argumentation Methods**

A competent argument limited by qualification or reservation (1) invariably contains a properly stated claim and, (2) is supported by appropriate and sufficient evidence (Campbell, 1982). However, the structure of an effective argument (or series of arguments) may vary according to what seems most appropriate in a given situation. A traditional argument may be presented in a deductive sequence in which the claim (with adequate qualification or reservation) is first stated and then substantiated with appropriate and sufficient evidence. Alternatively, an enthymematic argument may be presented in an inductive sequence. For instance, selected evidence may be presented while the claim remains unstated. In some situations an enthymematic structure may be most effective because the Chinese can draw their own conclusions in the context of the situation as it relates to their needs and their motivations.

Various types of evidence appear throughout the wheat negotiation strategies. These include: examples, statistics, and expert testimony. In some cases, the evidence is presented in a particular structure designed to maximize persuasive effectiveness. Such arrangements include: residual reasoning patterns, criterial reasoning patterns,

---

18 Refer to Appendix B re argumentation theory.
and comparative advantage patterns.\textsuperscript{19}

\textbf{Adaptation Methods}

Effective communication strategies must be tailored to fit the contingencies of the particular situation. In the context of the wheat negotiation, such tailoring required a careful analysis of (1) Chinese demography, (2) potential Chinese disposition, and (3) the situation in context. When the negotiators have dependable intelligence information and "estimates" (forecasts), they are better able to invent adaptive strategies; that is, appropriate and palatable to the Chinese. For example, if U.S. intelligence indicates that the Chinese may be considering the development of alternative sources of low-cost nutrition in China, then U.S. negotiators can invent negotiation strategies that serve to adapt to China's "low-cost nutrition" criteria.

Adaptiveness considerations also include the arrangement of strategies. Timing is a key element of adaptation. Because strategic timing must be tailored to fit the inferred Chinese point of view in order to maximize persuasive potential, when a strategy is introduced may be just as important as the content of a strategy. For example: When would U.S. negotiators strategically introduce cost comparisons of "discounted" HQS wheat with other Chinese food sources? Immediately following nutritional comparisons of HQS wheat with other Chinese food sources.

Included among adaptation considerations for these wheat negotiation strategies are the choices of both verbal and nonverbal symbols. The complexity of potential obstacles arising from culture-specific

\textsuperscript{19}Refer to Appendix C re evidence structure.
interpretations highlights the need for a Chinese language and culture expert on the U.S. negotiation team in order to plan effectively and to implement adaptive communication strategies.

**Choice-Sharing and Choice-Restricting**

Five contrasting dimensions of the choice-sharing model of human communication applicable in the context of this negotiation situation were introduced in Chapter II. They are:

- Win/win or lose/lose goals
- Cooperative aims
- Power parity
- Share choices
- Risk Change

A comparison of contrasting characteristics reflecting each of these dimensions was illustrated by examples of negotiation dialog in Chapter II. While these examples serve to highlight the differences between choice-sharing and choice-restricting strategies, they may oversimplify the distinction between the two. The dialog examples suggest that choice-sharing can be separate from choice-restricting; that negotiators may choose to employ either one or else the other as a means of communication. But in practice, choice-sharing and choice-restricting may overlap, when, for example, negotiators need the option of sharing some choices and restricting other choices in order to be adaptive.

The communication strategies designed for this wheat negotiation are grounded in a win/win orientation: The strategies are intended to encourage cooperative, creative problem-solving efforts aimed toward win/win solutions. Negotiators seek to share as many choices as feasible. But sometimes the win/win orientation virtually dictates choice-restricting
strategies. A methodical way to restrict choices is by means of criterial reasoning. Approved criteria for evaluating possible agreements are established by the U.S. negotiators during the preparation phases of negotiation. Subsequently, the U.S. negotiators may remain willing to share power and risk some changes; but they are bound to share only those choices that satisfy the pre-established criteria. Examples of U.S. criteria include: economic feasibility; wheat availability; China's needs; long-term relationship with China; and U.S. credibility.

Furthermore, the number of plausible choices for sharing may be constrained by intelligence or disclosures: For example, among China's criteria for settlement may be a "storage feasibility" requirement. If so, the Chinese negotiators would not be able to make a deal for any more wheat for storage than prescribed by that criterion. Such limitations may, in turn, limit the U.S. negotiators' authorization to offer "bargain" prices associated with a large volume sale in accord with the U.S. "economic feasibility" criterion.

Negotiators can work together to discover mutually satisfying, perhaps innovative, options that fall within criteria set forth by each party. When choices are jointly narrowed to those that are most acceptable from each party's point of view, agreement may follow.

Discovering Rhetorical Obstacles

One of the primary values of rhetoric, according to Aristotle, was that it provided a method for discovering the information necessary to make decisions on human affairs. (Harper, 1979, p. 35)

A way to effectively design communication strategies from a rhetorical perspective is to detect potential rhetorical obstacles in the context
of the situation. "A problem is the gap between what you have and what you want" (Campbell, 1982, p. 69). The obstacles that U.S. negotiators may face while negotiating constitute a "rhetorical problem." Campbell outlined three aspects of a rhetorical problem:

(A) obstacles arising from the audience;
(B) obstacles arising from the subject/purpose;
(C) obstacles arising from perceived source credibility.

The interrelationship of the three aspects is illustrated by the triangle below left. The triangle on the right represents a translation from theoretical terms to terms applicable to the U.S./China wheat negotiation example.

(A) Audience (B) Subject/ Purpose
\[ \text{All obstacles faced by communicator initiating rhetorical action.} \]
\[ \text{(C) Rhetor (credibility)} \]
(A) Chinese Audience(s) (B) Wheat Negotiation/
Manage
\[ \text{All obstacles faced by U.S. negotiators negotiating a wheat deal with the Chinese.} \]
\[ \text{(C) U.S. Negotiators (credibility)} \]

The following preview and subsequent explanations serve to highlight and clarify the three categories of potential rhetorical obstacles.

---

20 Components of the system by which negotiators can diagnose potential rhetorical obstacles are taken from Karlyn Kohrs Campbell's book, *The Rhetorical Act* (1982). Since Campbell's perspective focuses on the application of rhetoric, including problem analysis and strategy selection, it seems compatible with the objectives of this methodology. However, the application of the rhetorical concepts in this context is not incompatible with other rhetorical researchers including Harper, Burke, Baldwin, Aristotle, and others.
Preview of Rhetorical Obstacles

(A) Obstacles Arising from the Chinese Audience(s)

   (a) Complexity
   (b) Cultural history

(2) Purpose-related
   (a) Cost
   (b) Perceived control

(C) Obstacles Arising from U.S. Negotiator's Perceived Credibility

(1) Credibility Characteristics
   (a) Competence
   (b) Trustworthiness
   (c) Goodwill

(2) Prior Credibility
   (a) Reputation
   (b) Appearance
   (c) Introduction
   (d) Context

(3) Credibility During Rhetorical Act
   (a) Identification
   (b) Social power
   (c) Participation
(A) Obstacles Arising from the Chinese Audience(s)

The Chinese audience in the context of a U.S./China wheat negotiation may represent at least four orders of abstraction:

Chinese Audience(s)

High Government Officials

Behind-the-scene Authorities:
- Decision Makers

Chinese Negotiation Team

Individual Member of Chinese Negotiation Team

Each audience level needs to be considered for potential rhetorical obstacles. Obstacles related to the Chinese audience may stem from their (1) perceptions and interpretations, or (2) motivations.

(1) Perceptions and Interpretations

According to Campbell (1982), (a) attitudes, (b) beliefs, and (c) message decoding can affect people's perceptions and interpretation of a message.21

(a) Attitudes

"Attitudes are likes or dislikes, affinities or aversions to situations, events, objects, people, groups, or any identifiable aspect of one's environments" (Campbell, 1982, p. 77). For example, according to negotiation

---

21If Campbell's analysis is not culture-bound, it is likely to be at least influenced by a Western point of view (which may not include, e.g., considerations of yin and yang).
researcher, Pye (1982), some Chinese negotiators may have an attitude of suspicion toward Westerners.

(b) **Beliefs**

"A belief is a judgment about what is true or probable, real or likely. . . . Insofar as attitudes are learned from our own experiences or those of others, they are based on beliefs, on what we consider true or likely" (Campbell, 1982, p. 79).

(c) **Message decoding**

Message decoding is a term used to refer to "the interpretative process by which listeners translate and interpret messages, assign meanings, determine relationships, and draw implications" (Campbell, 1982, p. 80). Message decoding is a notable obstacle because of verbal and nonverbal symbol differences between cultures.

(2) **Motivations**

Campbell indicates that motivations are influenced by (a) needs, and (b) values.

(a) **Needs**

"People act for reasons. They pursue goals, they are motivated, they try to satisfy their needs" (Campbell, 1982, p. 81). U.S. negotiators need to assess plausible needs from the Chinese point of view.

(b) **Values**

"Values express strong, basic, and very general views of how one should act or what goals one should seek (what
goals are worthy of seeking" (Campbell, 1982, p. 83). For example, if what we read regarding recent government policy changes aimed toward improved quality of life in China are accurate (Omaha World-Herald, October, 1984), then the goal "quality life" may be among the values upon which Chinese government decisions are being made.

Obviously, the U.S. negotiators need to understand all they can about the people with whom they are negotiating—from the individuals on the negotiation team to decision makers not present at the negotiation table. "In every case, you must consider how to use the beliefs, attitudes, and values of the audience (Chinese negotiators) in order to reach them and induce them to participate" (Campbell, p. 89). The function of an enthymeme will depend, in part, upon the belief, attitude, and value system of each Chinese participant.

(B) Obstacles Arising from Subject and Purpose

Although the Chinese 'audience' is central in an analysis of rhetorical obstacles, equally important is the Chinese negotiators' interrelationship with the (1) subject and (2) purpose of the rhetorical act.

(1) Subject-related Obstacles

According to Campbell, two major obstacles that stem from the subject include resistance created by: (a) complexity, and (b) cultural history of the issues.

(a) **Complexity**

Subjects seem complex when they are remote from the others' personal experience; when they require some kind of technical
knowledge or expertise; and when they are bound up with many other difficult issues.

When the subject is outside the realm of personal experience, one has to rely on data gathered by others and interpretations made by experts. Although the Chinese may have plenty of experience negotiating wheat deals, there may be aspects of any particular negotiation that are unfamiliar to the Chinese negotiators. For example, if they have previously imported only LQS wheat and if they are unfamiliar with automated bread-production procedures, then an offer centered around bakery construction assistance in exchange for a purchase of some HQS wheat may be out of the Chinese negotiator's realm of personal experience.

When a subject requires technical knowledge or expertise, the audience may tend to resist participation. "In this situation, the rhetor must become the educator . . . [seeking to] alter the audience's perception of their own competence" (Campbell, 1982, p. 103). If Chinese negotiators are not well informed on HQS wheat characteristics in relation to nutrition and diet-variety advantages, then a U.S. offer of a portion of HQS wheat--even if supported by arguments based upon quality specifications in relation to nutritional benefits--may be met by resistance.

When a subject is intertwined with other difficult issues, the complexity that results may be an obstacle to reaching an agreement. Examples of such issues include
the strength of the U.S. dollar; textile import disputes; Taiwan.

(b) Cultural history
Some obstacles that stem from the subject may have originated long before the time of the communication transaction. For example, the cultural history of any particular negotiation may include experiences that Chinese negotiators may have had with the present or other U.S. companies, or with wheat traders from other countries.

(2) Purpose-related Obstacles
Negotiators must not only deal with subject-related obstacles, they need to consider factors that may inhibit efforts aimed toward achieving the purpose of negotiation. Purpose-related obstacles may stem from both (a) cost factors, and (b) perceived degree of control.

(a) Cost
The rhetorical problem of cost refers to the price that must be paid not only in terms of money, but also time, energy, commitment, expertise, ridicule, and so on. The greater such costs, the greater the resistance. For example, if the U.S. government were to grant political asylum to a Chinese defector during these negotiations, the "cost" to the Chinese of a wheat agreement in terms of perceived loss of face, at this time, might be too high.

(b) Control
Obstacles arising from control relate to the characteristics of the audience and the audience's perception of who can
control what under the circumstances of the negotiation. For example, the U.S. team may need to recognize that ultimate control may lie with officials not present at the negotiation table.

(C) Obstacles Arising from Credibility

Ideas do not walk by themselves, they must be carried—expressed and articulated—by someone. As a result, we do not encounter ideas neutrally, objectively, apart from a context; we meet them as someone's ideas. (Campbell, 1982, p. 121)

The audience is influenced by the perceived character of the source. Source credibility depends upon perceived competence (expertise), trustworthiness, and goodwill (concern for other's interest). Campbell makes the distinction between (1) prior credibility and (2) credibility during the communication act.

(1) Speaker's Prior Credibility

Attitudes toward the speaker prior to the rhetorical act may be influenced by: (a) reputation, (b) appearance, (c) introduction, and (d) the context in which the communication act is presented.

(a) Reputation

Previous actions may affect perceived credibility. Individual U.S. negotiators may be seen as a part of multi-level groups, each with a perceived reputation. For example, the individual is a member of a team, representing a particular

---

Note the distinction between "credibility" and "credibility trend" as used in the context of this methodology. Credibility refers to the competence, trustworthiness, and goodwill of the negotiators as perceived by their audience. A credibility trend is a result of accumulated intelligence that denotes the direction and degree of believability of any claim.
U.S. company. This company is one of many U.S. wheat trading companies--and so on--all of which contribute to the perceived reputation of the U.S.

The diagram below illustrates multi-ordinal aspects of the U.S. negotiators' reputation.

(b) Appearance
Dress, posture, and observed manners become part of the perception of credibility.

(c) Introduction
Initial contact may set the tone for perceived credibility.

(d) Context
The context in which this particular negotiation occurs may have an effect on perceived credibility. For example, Chinese attitudes stemming from the textile dispute may be an obstacle.

(2) Credibility During Negotiation
Attitudes during negotiation may be influenced by: (a) identification, (b) social power, and (c) participation.
(a) **Identification**
Obstacles may arise from the lack of perceived similarities between U.S. and Chinese negotiators. U.S. negotiators can minimize these obstacles by seeking to establish common ground and mutual goals.

(b) **Social power**
Social power refers to the degree of influence one negotiation team may have, or be perceived to have, over the other. Efforts aimed toward sharing social power may help to minimize distrust.

(c) **Participation**
Chinese negotiators' willingness to participate in the process of negotiating—particularly a willingness to participate in an enthymematic argument—will be influenced by their perception of the U.S. negotiators' trustworthiness, competence, and goodwill toward them and their constituents.

**The Rhetorical Schematic**

Figure 4 shows the three-part process of generating communication strategies by way of the Rhetorical Schematic. During Stage One, negotiators assess which trends (based upon accumulated intelligence) seem most credibly related to a given negotiation topic. During Stage Two, negotiators seek answers to the question: Which rhetorical obstacles are likely to exist in relation to the given topic? During Stage Three, negotiators generate adaptive communication strategies, given the assessment of credibility trends and the diagnosis of rhetorical
Figure 4. Rhetorical Schematic
obstacles related to the particular negotiation topic. 23

Procedural Directions for Using the Rhetorical Schematic

Stage One:

Although all of the topics related to the negotiation situation are interrelated, each topic, and the set of credibility trends related to each topic, are presented in Stage One of the Rhetorical Schematic as if they could be isolated.

During the process of formulating credibility trends, however, negotiators may choose to shift the focus from single topics to those issues that are likely to be most immediate in the context of negotiation discussions. For example, as illustrated by Figure 5, credibility trends related to "how much wheat China might consider buying from our company" (Quantity) are grounded in intelligence related to China's current wheat crop and forecasted wheat consumption (Need); the amount, quality, and price of wheat available from other countries (Global Wheat Situation); and China's present attitude toward the U.S. stemming from "unrelated" issues such as "textile," "Taiwan," and strong U.S. dollar issues (Willingness); not to mention other immediate issues such as

23 The communication "strategies" generated in Stage Three of the rhetorical schematic encompass "tactics" as well. It may be helpful to note the vague, somewhat overlapping distinction between the two. A way to explain the differences may be by way of a simple sailing analogy. If one were to set out on a sailing voyage, s/he would probably first chart a course, planning long-range strategies aimed toward reaching a particular destination alive. Included in the strategies may be specific tactical maneuvers designed to accommodate a variety of potential circumstances that may be encountered; for example, an abrupt change in weather conditions or an unforeseen problem with a piece of equipment. Although it may be difficult, in some cases, to distinguish the tactics from the strategies, each is important in order for the sea-farer to reach the designated destination. Similarly, communication strategies might include specific, more immediate tactics adapted to a particular set of circumstances.
Figure 5. A Structure for Formulating a Credibility Trend by Interrelating Issues and Contexts Relative to Any Given Negotiation Topic.
price, quality, and shipping.

Stage Two:

Each set of credibility trends related to a particular negotiation issue is then fed into the Stage Two "inquiry box" where it is diagnosed for rhetorical obstacles. At this stage negotiators determine whether or not there may be rhetorical barriers associated with (1) Chinese perceptions and motivations in this context, (2) the subject or purpose of the negotiation, and (3) the credibility of the U.S. negotiators. If any one of the categories is determined to be a potential obstacle, the negotiator can proceed through the diagram considering specific aspects of that particular category. If the negotiator determines that there may be more than one set of obstacles, the diagram allows for the negotiator to recycle through and identify additional potential obstacles as needed.

Stage Three:

The final process entails generating a repertoire of appropriate communication strategies and tactics; both are the "offspring" resulting from the "marriage" of Stages One and Two of the Rhetorical Schematic. The strategies can be generated as a natural result of the confrontation between: (1) each set of credibility trends related to a specific negotiation topic and, (2) the rhetorical obstacles diagnosed to be present in the context of that set of topical trends.

The following examples serve to illustrate the use of the Rhetorical Schematic for generating a repertoire of communication strategies and tactics in the context of a prospective wheat negotiation between representatives of the U.S. and China grounded in the realistic negotiation
situation formulated in Chapter II. The structure of the examples matches the three stage structure of the Rhetorical Schematic. For simplification, the documentation data upon which the credibility trends relating to each negotiation issue are based appear in the form of outline symbols. The symbols serve as cross references to the corresponding data originally documented in Chapter II. New information is documented according to the previously established pattern. Symbols that appear in Stage Two of the following examples correspond with the symbols in Stage Two of the Rhetorical Schematic diagram.

Although the natural order of negotiating would require early consideration of both immediate and future relationships as they pertain to selecting communication strategies, the order of presentation of selected issues is shown in Figure 5, page 179.

Which trends seem most credible based upon factors related to the quality of wheat China may import in 1985?

- Which rhetorical obstacles are likely to exist in relation to the quality of wheat to be imported?
- Which communication strategies (or tactics) may be most appropriate for quality-related proposals?

(A) China's current wheat crop?

1. Quantity *(Farm Futures, 1984)*?
2. Ratio of quality/quantity specifications (intelligence)?

(B) China's specified current year nutrition and diet-variety goals (III/B/2)?

1. Minimum individual nutrition consumption?
2. "New to China" wheat products. For example: (a) hamburger buns (b) French bread or pastry *(Sioux City Journal, October 17, 1984)*?

(A) Chinese audience-related?

1. Perception of HQS wheat needs (e.g., skepticism) in relation to their motivation for improved nutrition and diet-variety?

(B) Subject and purpose related to:

1. Perceived complexity of wheat quality discrimination because of history of wheat imports limited to LQS (IV/C)?
2. Costs related to HQS imports?
3. Degree of decision-making control among Chinese negotiators?

- Ask open questions designed to:
  1. Confirm or disconfirm quality-related intelligence (Stage One);
  2. Determine degree of familiarity or interest in HQS wheat;
  3. Determine priority of HQS wheat (to include established budget allowances);
  4. Establish an attitude of interest in (a) China's needs and (b) mutual benefits for U.S. and China.

- In the case of a positive, interested response to the above, inquire about whether they would like an informative briefing about HQS wheat.

(C) Previous import ratio of HQS/LQS wheat (intelligence)?

(D) Formula (based upon credibility trends) designed to identify China's wheat quality and quantity needs?

Formula forecast assumes:

1. LQS - 9-11% protein
   1-2% ashes (as is moisture)?
2. HQS - 11.5-14% protein
   .5-1% ashes (as is moisture) (III/B/2)?

- If so, have a nutritional expert give a presentation with explanatory visual aids which might include:

  1. Comparison charts of relevant wheat specifications;
  2. Pairs of sample wheat products—one each made of HQS wheat flour and LQS wheat flour;
  3. Nutritional content comparisons of wheat products—both HQS and LQS—with other sources of present nutrition in China.

- Introduce formula (based upon related credibility trends) designed to allow the Chinese negotiators a means to determine their own wheat quantity/quality ratio needs.

(3) China's need for U.S. wheat (III)?

- (2) Discuss and document actions we have taken within the U.S. to change the status quo. Examples might include:
  (a) Lobbying activity;
  (b) Public letters.

- Introduce a visual comparative evidence structure which serves to compare the advantages and disadvantages of dealing with this U.S. company.

Transition: Up to this point, communication strategies regarding past and present considerations have been generated. The remaining strategies were generated in order to include considerations in the future.

In order to maintain the win/win orientation, it is essential for the negotiators to continue with their problem-centered approach, cooperative attitude, and high concern for both their own and their protagonists' welfare (cf. Frost & Wilmot, 1978, pp. 27-32; Crable, 1979, pp. 175-179). These characteristics of the win/win orientation are congruent with the notion of power parity in the choice-sharing model of communication.

- Reinforce/clarify above substantiation by way of visual charts, and written handouts (which may also serve to avert message distortion if Chinese negotiators meet with Chinese decision-makers not present at these negotiations).
Summary

The foregoing examples serve to illustrate the procedure for generating negotiation strategies by way of the Rhetorical Schematic. A repertoire of strategies was generated in Stage Three as a result of (1) an assessment, in Stage One, of credibility trends related to each negotiation topic, and (2) a corresponding diagnosis, in Stage Two, of rhetorical obstacles related to the negotiation topic.

Various methods are employed during the strategy-generating process, including: (1) plausible reasoning methods; (2) methods by which negotiators can gain and maintain perspective; (3) joint, creative problem-solving methods; (4) argumentation methods; and (5) methods for adapting strategies to the particular negotiation situation.

Plausible Reasoning Methods

Each negotiation topic introduced in Stage One of the Rhetorical Schematic represented a set of credibility trends derived from intelligence gathered by plausible reasoning methods. Because credibility trends are provisional in nature, to be challenged, reaffirmed or strengthened throughout the negotiation process, they were presented as interrogatories. In the case of wheat-quality-related trends which compare HQS wheat with other sources of nutrition in China, the available data provide the framework for a comparative structure for which quantitative estimates are yet to be supplied. Further intelligence work may require input from certain experts, perhaps the team's wheat-quality expert or Chinese cultural expert.

Methods by Which to Gain and Maintain Perspective

Negotiators develop a holistic perspective on the negotiation situation by gathering relevant intelligence; by categorizing intelligence
into related sets of data and then seeking to "fill in the gaps" as needed throughout the negotiation process. When negotiators focus on one set of credibility trends (relating to a particular negotiation topic), those trends are the Gestalt figure, grounded in other relevant negotiation issues. For example, when quality-related trends were analyzed by way of the Rhetorical Schematic, they were grounded in quantity, price, shipping, and human relationship issues. Each set of credibility trends was similarly grounded in contextual factors including: Chinese cultural factors, China's willingness to buy U.S. wheat, China's need for wheat, and the global wheat situation.

**Joint, Creative, Problem-Solving Methods**

The repertoire of communication choices is predicated upon the orientation that both U.S. and Chinese negotiators can be "winners." Creative problem-solving methods set forth in Nierenberg's win/win negotiation theory call for the joint discovery of perhaps novel solutions to a mutual set of problems. An illustration of a win/win approach appears in the shipping-related strategies. A non-traditional "delayed shipment/delayed payment" offer designed to accommodate China's present "lack of sufficient foreign capital" problem may be a step toward a novel solution to a difficult problem in the context of this wheat deal.

**Argumentation Methods**

The foregoing wheat-strategy examples represent a systematic utilization of argumentation methods. For example, the quality-related strategies serve to illustrate the development of an enthymemematic argument series. "Good" reasons, generated to support the unstated
claim "China may need to import a portion of HQS wheat in order to effectively meet their published nutrition and diet-variety goals," were designed to appeal to the Chinese point of view. The quality-related strategies called for evidence to be compiled and presented by U.S. and Chinese nutrition experts. Statistics, expert testimony, and examples were to be tailored to fit the Chinese experience. Timing of the introduction of quality-related evidence, in relation to other negotiation topics, was to be adapted to the inferred receptiveness of the Chinese negotiators. Quality-related evidence included:

(1) visual comparisons to supplement a verbal explanation of relevant wheat specifications;

(2) visual comparisons of numerous wheat end products desired by the Chinese—-from fast food buns to French pastries; two samples each—-one made with HQS wheat flour, the other with LQS wheat flour;

(3) comparison chart illustrating the nutritional components of HQS wheat, LQS wheat, and other sources of nutrition in China;

(4) cost comparisons of nutrition sources;

(5) a formula based upon trends of wheat supply and consumption in China which would allow the Chinese negotiators the option to "fill in the blanks" with the most up-to-date quantitative data (probably available only to the Chinese) and calculate their needs based upon statistical forecasting methods.

Once the series of evidence is presented to the Chinese by way of an enthymematic format, the Chinese negotiators can draw their
own conclusions about how much and what standard of wheat quality they need at this time in order to meet their nutrition and diet-variety goals. If U.S. negotiators had chosen to first state the claim "China may need to import a portion of HQS wheat in order to effectively meet their published nutrition and diet-variety goals," and then proceed to prove the claim by way of logical deduction, the proposal might have had less persuasive impact.

Adaptation Methods

The repertoire of communication strategies generated for the wheat negotiation between representatives of the U.S. and China reflects the use of adaptation methods. Strategies are designed to target the Chinese viewpoint. The intelligence-gathering stages of preparation serve to provide negotiators not only with information about the subject, purpose, and context of the negotiation, but also information about the audience. The rhetorical analysis (Rhetorical Schematic) of that accumulated data makes it possible for negotiators to tailor strategies to fit this audience in this particular context at this particular time.

Adaptation efforts can have both short-range and long-range implications. In some cases, at first glance, those implications may seem to be contradictory. For example, in the case of the future-related strategies, U.S. negotiators learned through intelligence that "the Chinese want automated bakery technology." They also discovered some feasibility problems associated with China's instituting "state of the art" bakery technology; e.g., prohibitive costs, specialized skills required for the operation and maintenance of equipment, and
minimum wheat quality (protein content) required for optimal functioning of sophisticated machinery. Audience-related intelligence of this nature led the U.S. negotiators to formulate an offer designed to meet China's long-range "developing technology" needs rather than their short-range "state of the art technology acquisition" needs.

It may not be in China's best interest to institute immediately the most sophisticated bakery technology. However, if the U.S. company were to assist the Chinese in converting an existing structure into an experimental, semi-automated bakery establishment which utilized automated techniques similar to those used in the U.S. in the 1950's—a facility which might serve as a prototype for additional establishments throughout China—then the Chinese might benefit in the long-run. Advantages might include:

1. Time to catch up and adapt technology to their cultural needs by researching production methods, conducting experiments, visiting high-tech bakeries in other countries, and training people.
2. Significantly lower capital investment than high-tech equipment would demand.
3. Lower maintenance costs than high-tech facilities.
4. Employment opportunities for a greater number of people than a high-tech bakery would allow.
5. A means to produce standardized wheat products to include: (a) fast food buns, (b) pastries, (c) loaves, (d) noodles, and (e) other items of interest to the Chinese.
6. Production processes that can be adapted to accommodate a
wider quality-range of wheat flour (lower protein levels if necessary).

Any such offer (series of arguments) might be most adaptive if it were presented enthymematically to suggest a quid pro quo option in exchange for a specified (range) wheat purchase.

Because negotiation circumstances are likely to be in a constant state of fluxuation, this methodology provides a systematic means by which negotiators can evaluate strategies throughout the negotiation process and make readaptations as needed. (This procedure is illustrated in Chapter V.)

Choice-Sharing and Choice-Restricting Strategies: Win/Win Orientation

A retrospective look at the repertoire of strategies reflects both choice-sharing and choice-restricting communication strategies grounded in a win/win negotiation orientation. Choice-sharing strategies reflect efforts to (1) establish mutual goals (whereby each party can win something); (2) cooperate (as is evidenced by negotiators who sought to understand and meet Chinese needs while, at the same time, seeking to meet the U.S. company's needs); (3) share power; (4) offer a range of choices; and (5) generate novel ideas (such as the "semi-automated bakery" proposal which represented some risk associated with initiating change).

Choice-sharing strategies were predominant; however, negotiators needed also to restrict choices in order to stay within feasibility limitations. Criteria for agreement that emerge during the strategy-generating process can serve as boundaries beyond which negotiation options may need to be restricted. Emerging U.S. criteria included:
(1) economic feasibility, (2) global-market competition, (3) commodity availability, and (4) long-term-relationship potential with China. These criteria, in conjunction with the emerging Chinese criteria, serve to guide negotiators toward decisions.

Chapter IV has been a step-by-step explanation of the three-stage procedure for generating communication strategies: Stage One, formulating credibility trends related to each negotiation topic; Stage Two, diagnosing rhetorical obstacles related to each negotiation topic; and Stage Three, generating communication strategies as a result of the combined analysis of Stages One and Two.

Incorporated into the repertoire of strategies are numerous methods: plausible reasoning methods, methods to gain and maintain perspective; joint, creative, problem-solving methods; argumentation methods; and adaptation methods. Both choice-sharing and choice-restricting strategies were grounded in a win/win orientation.

Chapter V illustrates a two-fold procedure by which negotiators can evaluate the wheat negotiation strategies in order to determine whether or not they are "on course."
EVALUATION OF COMMUNICATION STRATEGIES AND THE METHODOLOGY

This chapter provides guidance for evaluating the strategic (including tactical) choices of the negotiation team. The evaluation process can be compared with Norbert Weiner's Human Cybernetics as characterized by Bois.

Human cybernetics is the art of steering the whole person--mind, body, and activities, all immersed in a space-time environment--to obtain the most from one's personal resources. By the use of feedback controls, guidance systems are able to keep missiles set on their target even if it shifts its course to elude them. Similarly, we can speak of a personal guidance system which is not automatic because it is human, but which is highly responsive and resilient. (Bois, 1979, pp. 18-19)

Characteristics of a system by which negotiators can guide negotiations may be analogous to specific characteristics of a cybernetic system. For example, the personal guidance system for negotiators must be highly responsive and resilient. It must provide a means by which negotiators can use "feedback controls" to manage the direction of negotiations. However, such characteristics, unlike a missile guidance system, cannot be achieved by automation. This methodology provides a human cybernetic-like, do-it-yourself "guidance system" whereby negotiators can systematically evaluate sets of negotiation data and make appropriate readaptations as needed in an effort to guide the directions of negotiations.

The guidance system built into this methodology was designed to serve two functions: (1) a retroreflective function--a look back at sets of negotiation strategies in an effort to determine whether or not they met rhetorical communication standards in the circumstances
for which they were designed; and (2) a prospective function—a look forward in an effort to determine what, if any, mid-course strategic corrections may be required in order to meet necessary wheat-agreement criteria in the context of unforeseen negotiation contingencies.

If negotiation strategies meet both: (1) rhetorical standards during a retroreflective evaluation, and (2) wheat-agreement criteria during a prospective evaluation, then the methodology by which the strategies were generated can be said to be functioning as intended.

Retroreflective Evaluation

The retroreflective evaluation utilizes a composite checklist comprised of the feed-forward communication standards introduced in Chapter I. They are: (1) argumentation standards; (2) rhetorical adaptation standards; (3) intelligence standards; and (4) win/win negotiation standards. Although components within each of the four sets of standards are presented in linear fashion, each set of components can be equipped with a feedback loop allowing the negotiator the option to recycle through each set of standards as needed.

Each preparation phase of the U.S. and China wheat negotiation situation was evaluated retroreflectively by way of the composite checklist of standards. The following tabulation of standards (Table 7) points out that negotiation is not likely to be an activity in which 100% of the standards are achieved, or even applicable, all of the time. Instead, the achievement of standards is an on-going, incremental

26 Please refer to Appendix D for a comprehensive explanation of each of the retroreflective standards.

process. This kind of on-going, retroflective evaluation allows the negotiators a chance to "repair" their perspective while progressing from one phase of negotiation to the next.

Use of the retroflective evaluation checklist of standards is illustrated in the following section by way of the wheat-quality-related communication strategies selected from Chapter IV. The communication strategies--originally generated by way of the Rhetorical Schematic--appear in the left-hand column. The evaluation checklist with appropriate coded notations appears in the center column. Corresponding explanatory comments are found in the right-hand column. A classification code was invented in order to identify the assessed status of each of the evaluated negotiation strategies. The coding system is as follows:

- ✓ - the standard was met;
- \( ✓ \) - the standard was partially met;
- x - the standard was not met;
- ? - some doubt at the time of assessment;
A blank space indicates that the particular standard was inapplicable.

Prospective Evaluation

In addition to an evaluative look back at the numerous phases of negotiation preparation, it may be equally important for negotiators to look ahead in order to determine whether or not there may be a need for mid-course corrections. This forward-looking evaluation process requires the use of imagination and plausible reasoning methods. Negotiators need to invent plausible scenarios which may include external and internal interferences, or both. For example, what if the Chinese negotiators respond to the "open question" strategies with blank looks and silence? Or what if an international incident occurs midway through negotiation meetings in which a Chinese gymnast defects from China and is subsequently granted political asylum by the U.S.?

In an effort to answer "what if" questions such as these, negotiators may seek to discover potential strategy-related problems by viewing the invented plausible scenarios from the Chinese viewpoint. To do so would be to practice what Delia and Clark call "social perspective-taking": in order for one individual to take the perspective of another, s/he must "reconstruct a pattern of representation of certain attributes of the (other's) environment, and then adapt to that environment as s/he has constructed it" (1977, p. 69). According to Delia and Clark, the ability of social perspective-taking is achieved, in part, through the development of an individual's social construct system (cognitive complexity) which seems to become more differentiated with age. They sought to determine the relationship between social perspective-taking and adaptive communication by conducting a study involving fifty-eight children, ranging from second through ninth grades. As a part of
this study, each child was instructed to describe a situation in which another individual found him/herself. The child was then asked a series of questions designed to elicit his/her construal of the other's perspective "in order to determine the extent to which the child understood the motivations the other might reasonably provide for his action... Answers reflected a high degree of perspective-taking. Indicators of perspective-taking included a child's ability to "suspend his own evaluation of the act and provide what would be a reasonable explanation for the behavior within the other's perspective." The study revealed that not only does "social perspective-taking seem to improve with age," but there is a high correlation (p. 64) between social perspective-taking and effectiveness in adapting persuasive communication (Delia & Clark, 1977, pp. 129-131).

It does not seem presumptuous to say that U.S. negotiators could do in the context of these wheat negotiations what those children did. By "doing" social perspective-taking, U.S. negotiators can scrutinize sets of communication strategies as if they were functioning within a reconstructed set of Chinese circumstances. Thus, they can determine whether or not tactical mid-course corrections may be appropriate.27

Each set of negotiation strategies was systematically reviewed in the context of a scenario imagined by "perspective-taking." In most cases, the originally designed communication choices remained

27An application of this perspective-taking evaluation method reiterates the need for a Chinese cultural expert on the U.S. negotiation team. In addition to "perspective-taking" among designated team members, U.S. negotiators may choose to plan a "dry run" negotiation in which a Chinese expert, who is not a member of the team, is invited to listen to negotiation strategies with a "fresh" ear in an effort to imagine potential obstacles within a reconstructed Chinese perspective.
generally appropriate, requiring only minor tactical readaptations. For example, Chinese negotiators might perceive the general negotiation orientation-behavior of U.S. negotiators in the present context as being inconsistent with orientation behavior typically observed during negotiations with western wheat trading companies. What if, as a result of these perceptions, the Chinese negotiators are cautious, suspicious, and generally reluctant to respond to open questions? An answer to that question may reflect some changes in communication; however, those changes should not be strategic, but tactical. Such tactical "fine-tuning" might include the following:

(1) Seek intelligence on Chinese apparent reluctance;

(2) (meanwhile) Observe both verbal and nonverbal cues. Validate verbal symbols against nonverbal symbols in order to avoid doing anything that might exacerbate the situation;

(3) Consider pacing of negotiation progress; adapt to the Chinese rate of progress.

In addition to routine situations which may require tactical fine-tuning, there might be circumstances which would require mid-course corrections. It seems plausible to imagine that an intelligence report relating to this wheat situation could develop in the form of the following scenario grounded in data documented in Chapter II. Consider this set of circumstances:

Wheat negotiations between representatives of the U.S. and China began three weeks ago in Beijing, China. U.S. negotiators have been implementing selected preplanned strategies as appropriate in context. The Chinese negotiators seem to be
responding well to the general direction of communication strategies.

Presently negotiators are on a one-week break in negotiation sessions during which time Chinese negotiators have been meeting with Chinese government officials discussing details for a potential wheat agreement with the U.S. U.S. negotiators are waiting patiently for meetings to resume. They are optimistic that the Chinese negotiators may receive needed authorization to purchase a portion of HQS wheat as a part of the total wheat purchase in exchange for future bakery considerations in China.

Concurrent with these wheat negotiation meetings, U.S. and Chinese officials have been meeting in Geneva in an effort to resolve the textile dispute. Things have not been going so well. Chinese officials are displeased with the U.S. policies which call for "unfair" restrictions on textile imports from China. U.S. officials are unwilling to make any more adjustments in the textile policy proposals.

As a result of the textile negotiation stalemate, according to intelligence reports, Chinese officials have:

(1) walked out of the textile meetings; and
(2) planned to take retaliatory action against the U.S. by withholding grain purchases.

Furthermore, representatives from China may have been conferring with wheat traders from other MWE. Intelligence estimates indicate that adequate wheat is available at advantageous prices from Argentina.
The next step in the prospective evaluation process is to determine what—if any—mid-course communication strategy corrections may be advisable. The following section illustrates the three suggested steps for determining appropriate mid-course corrections. They are:

1. taking the Chinese perspective (left-hand column);
2. interpreting the situation (center column);
3. identifying emerging wheat agreement criteria from which to determine mid-course corrections as needed (right-hand column).

The following mid-course corrections suggested for this scenario are based upon the assumption that the Chinese negotiators may take one of two positions at the time negotiation meetings resume. The Chinese may choose: (1) a CLOSED position whereby they avoid exhibiting any knowledge of the textile-related developments, or (2) an OPEN position whereby they openly address the textile issue as it relates to these negotiations.

Summary

The foregoing evaluation procedure provides a means for negotiators to identify potential communication-strategy problems in the context of any wheat negotiation situation and formulate appropriate readaptations as needed.

Evaluation of the Methodology

An evaluation can serve to indicate the functioning capabilities of the communication methodology. If the communication strategies generated for the wheat negotiation situation meet the prescribed standards for competence and appropriateness, then one may ascertain that the methodology by which the strategies were generated is functioning as intended.

In an effort to detect serious omissions or errors among communication strategies, I systematically searched for incongruencies between the strategies and the rhetorical communication feed-forward standards introduced in Chapter I. While I found occasional need for minor readjustments (for example, the claim "HQS wheat may provide a level of nutrition comparable to that of more costly sources of nutrition utilized presently in China" might be better substantiated by way of visual charts that reflect research comparisons made by a Chinese nutritional expert) I was unable to find any incongruencies between communication strategies and those prescribed standards.

After evaluating the strategies retroactively according to the designated rhetorical standards, it became apparent that the strategies should also be evaluated prospectively in order to determine what,
if any, mid-course corrections might be needed in the event of "interference" from unforeseen negotiation contingencies such as the textile-related conflict.

Thus, the rhetorically-sound strategies were challenged; consequently, the implicit wheat-agreement criteria were made explicit so that the negotiators could responsibly evaluate the appropriateness of their strategies for adapting to various contingencies. Then they could make mid-course corrections as needed.

As a result of illustrating a prospective evaluation, I discovered that the methodology can accommodate mid-course corrections in order to make adaptations to unforeseen circumstances.

Inasmuch as neither the retroactive nor the prospective evaluation procedures disclosed any need to reconstitute the methodology, no need to "debug" it was found.
Chapter VI

CONCLUSIONS AND RECOMMENDATIONS FOR PROSPECTIVE RESEARCH

Statements in Chapter I reflect my desire to discover ways that people of different cultures or subcultures might manage conflict through negotiation. My personal association with a mid-western U.S. agricultural environment, and my particular interest in the Chinese culture, led me to create a communication methodology designed for a wheat negotiation between representatives of the U.S. and China.

This methodology was designed for direct use by company-selected negotiation personnel so that they can generate any combination of negotiation strategies to meet the needs of their particular situation.

In order to create the methodology, I constructed a realistic wheat negotiation situation between representatives of the U.S. and China. In Chapter II, I arranged available, relevant data into interrelated sets of data. From the organized sets of data, I sought to determine the structure of the unknown relevant data, illustrated in Chapter III. The process of determining the structure of the unknown is analogous to the search for a particular jig-saw puzzle piece. One can effectively search for the dimensions and details of a missing puzzle piece after recognizing the structure of what is missing in relation to the structure of the part of the puzzle that has been assembled. Once the structure of the unknown information pertaining to the wheat negotiation situation was determined, I was able to suggest capabilities or expertise needed for selecting or for recruiting and
training members of the negotiation team.

The procedure introduced in Chapter IV serves to guide the negotiation team as its members coordinate their efforts to generate appropriate and adaptive communication strategies. The "generator," called the Rhetorical Schematic, entails a three-step procedure: (1) formulate credibility trends related to each set of negotiation data; (2) diagnose potential rhetorical obstacles related to each set of credibility trends; and (3) generate communication strategies as a result of the combined analysis of steps 1 and 2. The Rhetorical Schematic was exemplified by generating adaptive strategies.

Finally, a two-fold evaluation procedure was introduced whereby negotiators review the strategies--both retrospectively and prospectively--in order to determine whether they meet: (1) the rhetorical communication standards set forth in the methodology, and (2) explicit agreement criteria (which should have emerged during the strategy-generating phase of preparing to negotiate). Both retrospective and prospective evaluation procedures were exemplified.

The orientation of this methodology is based upon the premise that in a successful negotiation both parties can win (Nierenberg, 1973). The choice-sharing model of human communication (Darnell & Brockriede, 1976) serves to identify characteristics of choice-sharing behaviors that seem to facilitate a win/win negotiation. A win/win orientation suggests that negotiators cooperatively seek mutually advantageous options by seeking to identify complementary goals, share power, risk change, and share choices insofar as feasible within the constraints of the designated wheat-agreement criteria.
When I attempted to represent an actual wheat negotiation situation by creating a realistic negotiation situation from the pertinent literature (documented in Chapter II), I was aiming toward "representationally validity": the extent to which the function of the methodology in the realistic wheat negotiation matches the function of the methodology in an actual negotiation situation (Poole & Folger, 1981, p. 27).29

Prospective research relating to this study should serve to test the methodology's usefulness in an actual negotiation situation.30 Selected negotiation personnel representing a U.S. wheat trading company need to be trained to understand and effectively use the methodological guidelines for planning negotiation strategies. Preparatory activities to be observed and evaluated should include: (1) formulating credibility trends relating to each set of negotiation data; (2) diagnosing potential rhetorical obstacles related to those data; (3) generating related communication strategies; and (4) evaluating the strategies retrospectively and prospectively. A follow-up assessment of: (1) negotiators' response to using the methodology for designing negotiation strategies; and (2) the nature of the on-going relationship between negotiation counterparts; may provide an additional source of substantiation for a researcher's claim regarding the potential usefulness of the methodology.

29The matching procedure in this methodology is analogous to the matching procedure in Poole & Forger's article: "A Method for Establishing the Representational Validity of Interaction Coding Systems: Do We See What They See?"

30Authors Brinberg and McGrath (1985) offer expertise in evaluation research; therefore, they could and perhaps should be employed as consultants for any further studies.
Although this methodology was designed for negotiators of a U.S. trading company who are seeking a wheat agreement with representatives of the Chinese government, there is no reason to assume that it would not be useful for other negotiation situations. In any case, this communication methodology might serve as one example of a systematic means by which people—even those from "opposite ends of the earth"—can cooperatively seek creative solutions to mutual problems.
The methodology for generating communication strategies in the context of a wheat negotiation with the Chinese might be compared to a grist mill. Whether serving to mill oats, wheat, or corn, the grist mill is designed to function according to an invariant set of processes. Similarly, the methodology has been designed to accommodate value changes within the broader limits of variables.

The values of the variables can change—and, in fact, have changed since I collected data for the realistic U.S./Chinese wheat negotiation situation—but the relationship among the variables remains invariant. For example, the "quantity of wheat consumed" (variable) by the Chinese in 1986 may be 125 mmt (value), compared to 90 mmt today. The "quantity of wheat produced" (variable) by the Chinese in 1986 may be 100 mmt (value), compared to 78 mmt today. However, China's "willingness to buy" remains a function (invariant relationship) of these two variables relative to their "need for wheat."

Furthermore, it is plausible to hypothesize that a negotiator might substitute "computer software" for "wheat" within the WHAT (service or commodity) variable; or substitute "Saudi Arabia" for "China" within the WHO variable.

Although changing facts are extremely important for the participants of a particular negotiation situation, the most up-to-date facts are not relevant to the functioning relationships of variables that constitute the methodology. Situation-specific differences represent changes in degree, not necessarily changes in kind (Korzybski, 1941).
APPENDIX A

PLAUSIBLE REASONING METHODS--INTELLIGENCE GATHERING
PLAUSIBLE REASONING METHODS--INTELLIGENCE GATHERING

Much of the relevant information gathered in the context of a negotiation situation will—presumably—lie outside the realm of probabilities and demonstrative logic. In addition to statistically predictable conjectures, negotiators presumably will need to make their guesses intelligent by means of plausible reasoning methods.

Polya makes the following distinction between plausible reasoning and demonstrative reasoning as it related to mathematics:

Finished mathematics appears in purely demonstrative form, consisting of proofs only. Yet mathematics in the making resembles any other human knowledge in the making. You have to guess a mathematical theorem before you can prove it; you have to guess the idea of a proof before you carry through the details. You have to combine observations and follow analogies; you have to try and try again. The result of the mathematician's creative work is demonstrative reasoning, a proof; but the proof is discovered by plausible reasoning, by guessing. (1954, p. viii)

According to Polya, "all knowledge outside of mathematics and demonstrative logic consists of conjectures . . .; we support our conjectures by plausible reasoning" (1954, p. v). He adds, "demonstrative reasoning is safe, beyond controversy and final. Plausible reasoning is hazardous, controversial and provisional." However, demonstrative reasoning is "incapable of yielding essentially new knowledge about the world around us. Anything new that we learn about the world involves plausible reasoning" (1954, p. v). "The efficient use of plausible reasoning plays an essential role in problem-solving" (1954, p. 10).

Polya offers no fool proof methods for using plausible reasoning. He noted that "the efficient use of plausible reasoning is a practical skill and is learned, as any other practical skill, by imitation and
practice" (1964, p. vi). According to Polya, plausible reasoning methods include (1) reasoning by induction; and (2) reasoning by analogy. When reasoning by induction, one might make a provisional claim—or forecast—based upon a collection of observable facts. "A conjecture by induction is suggested by observation, indicated by particular instances" (1954, p. 5). Observation of related events may—or may not—lend more, or less, credence to a given conjecture. A "credibility trend" refers to the direction of support for a given conjecture based upon accumulated observations relative to that conjecture.

When reasoning by analogy, a problem-solver may ask, "Have I seen a similar problem before?" "Two systems are analogous if they agree in clearly definable relations of their respective parts" (1954, p. 13). By systematically noting similarities and differences between the problem at hand and another, more familiar, comparable problem, one may find clues that will lead to a clearer understanding of the present problem.

Plausible inferences are provisional and tentative—more or less credible—and are not to be confused with probabilities. Probabilities, while unpredictable in certain details, are predictable in certain numerical proportions of the whole which can be computed according to the Calculus of Probability. Polya compared "credibility" with "probability" by noting "assumptions of interchangeability and symmetry" in the process of "determining" each (1954, p. 132). A statement of credibility related to a given conjecture can represent either a probability (statistical hypothesis) or a plausible inference, but
only the probability has a definitive numerical value. However, the relationship of the components associated with both probabilities and plausible inferences can be represented by similar mathematical equations which serve to indicate the direction of support—more or less credible—for a given conjecture.

---

31 Polya suggests that it is "safer", when lacking a statistical hypothesis, to "represent to yourself qualitatively how a change in this or that component of the situation would influence your confidence, but do not commit yourself to any quantitative estimate" (1954, p. 132).
ARGUMENTATION THEORY

An argument is the invention and arrangement of material aimed toward persuasion. "Arguments are the building blocks of rhetorical action" (Campbell, 1982, p. 193). Toulmin describes an argument as "movement by means of which accepted data are carried through a certifying warrant to a claim" (Brockriede & Ehninger, 1960, p. 47).

According to these authors, components of an argument include: a claim, reservations or qualifications, warrants, evidence, backing, and rebuttals.

Claim: An argument is a claim or a conclusion backed by reason. Claims are assertions beyond what can actually be proved.

Reservations or Qualifications: The power of a claim can be limited and the burden of proof reduced by limiting the scope of coverage with reservation(s) or by limiting the level of confidence with qualifier(s).

Warrants: Warrants--or reasons--are the grounds for drawing conclusions. Reasons arise out of knowledge accumulated in the specific context. They legitimize the leap from relevant data to acceptable claims. Legitimate "reasons" within one context may not be appropriate for another.

Evidence: Reasons for accepting a claim come from evidence gathered from relevant available data. Evidence cannot be discussed on solely logical terms, but must be adaptive to audience needs. Therefore,
"evidence can be judged by two criteria: (1) logical strength, and (2) psychological power" (Campbell, 1982, p. 174). According to Lucus (1983), forms of evidence include the following:

- **Brief examples**—often called special instances;
- **Extended examples**—longer, more detailed than brief examples, sometimes called illustrations;
- **Hypothetical examples**—examples that describe a "would be" situation;
- **Statistics**—documented numbers;
- **Testimony**—quote or paraphrase from a recognized authority.

**Backing:** Backing consists of credentials designed to "back up" the warrant.

**Rebuttal:** The rebuttal acknowledges the conditions under which the claim may not hold true.

The following diagram illustrates the relationship among argument components:

(Q)ualifier  
therefore,  
therefore,  
(C)laim

(D)ata

(W)arrant  
since

(B)acking  
because

(R)ebuttal  
unless

(Brockriede & Ehninger, 1960)
Figure 7 illustrates the structure of a sample wheat argument. The sample "meta-argument" consists of numerous sub-arguments. For example, each one of the "data" items is also a provisional claim which can stand alone. Each of the sub-claims upon which the meta-claim is based, must have adequate qualifications and reservations, and be supported by appropriate and sufficient evidence.

Preparing for a rhetorical argument calls for a creative role. Persuasive argument theory assumes that there is a culturally given pool of arguments on an issue (Campbell, 1982). According to that theory:

People take positions on issues because of the balance of arguments; that is, they decide where they stand based upon the number of pro and con arguments that have force for them that they know about. . . . As a result, novel or unfamiliar arguments become very important because such arguments may tip the balance . . . and change attitudes (p. 202).

One way to develop a novel argument is by formulating an enthymeme. As noted in Chapter I, an enthymeme is a particular kind of argument found in rhetoric. "An enthymeme is an argument jointly created by author and audience" (Campbell, 1982, p. 204). Through use of the enthymeme, the audience draws conclusions that may be plausible but not certain nor even probable. Although deficient by traditional logical standards, the enthymemematic argument "gains its force from the fact that the audience fills in evidence, or supplies warrants, or draws conclusions" (based upon their knowledge, experience, attitudes, and beliefs) (p. 204). The argument cannot be made unless the audience supplies the omitted part.

The comparison below serves to distinguish between two patterns of logic from which arguments can be developed--the demonstrative
therefore, it is plausible

- HQS wheat has a higher level protein content than does LQS wheat:
  HQS: 11.5-14\%^{32}
  LQS: 9-11\%

- Indications are that China produces predominantly LQS wheat at this time?

- Certain specialty wheat products may require dough consistency, color, and texture found only in HQS wheat?

- It is plausible that HQS wheat may provide more nutrition per unit cost than other sources of accepted nutrition in China?

Since China has indicated desires to improve nutrition and diet-variety;

as noted by published Chinese government reports;

according to statements made by Chinese negotiators.

Unless the cost of HQS wheat is prohibitive from the Chinese point of view;

Unless the Chinese do not yet have the facilities enabling them to process specialty wheat products;

Unless the Chinese are unwilling to consider such a purchase from the U.S. due to their disenchantment with textile policies;

Unless they can get similar quality wheat for a cheaper price from another source;

\(^{32}\text{Subclaims (credibility trends) supported by data previously documented in this study.}\)

Figure 7. Sample Wheat Argument Structure
syllogism and the heuristic syllogism. A formal deductive argument may follow the logic of the demonstrative syllogism, while the enthymematic argument may correspond with the logic of the heuristic syllogism.

<table>
<thead>
<tr>

</tr>
<tr>
<td>B false</td>
<td>B true</td>
</tr>
<tr>
<td>A false</td>
<td>A more credible</td>
</tr>
</tbody>
</table>

(Polya, 1945, p. 188)

Each of these conclusions is on a different logical level. The conclusion of the demonstrative syllogism is on the same logical plane as the premises from which it was built. The logical level of the heuristic conclusion differs from that of the premises. "It is more vague, less fully expressed, yet does show direction and magnitude." In the heuristic syllogism, the premises constitute only one part of the basis upon which the conclusion rests--the "visible" part. There is also an unexpressed, invisible part, formed by something else, by inarticulate feeling perhaps, or by unstated reasons" (Polya, 1945, p. 189). The logic of the heuristic syllogism can be applicable when negotiators are (1) developing their own conclusions as they begin to consider the "makings" of plausible negotiation strategies; or (2) planning how to most effectively present a pre-planned argument to the other party during a negotiation session.

If the argument (series of arguments) illustrated in Figure 7 were presented in a traditional deductive pattern of logic, each component of the argument might be stated in the appropriate logical sequence. However, if the U.S. negotiators choose to present this argument
enthymematically (as it appears among the sample strategies in Chapter IV), they may choose to leave some components of the argument unstated. For example, they may decide to withhold a statement of the conclusion—and instead present carefully selected, well timed points of evidence, each with appropriate and sufficient evidence—in an effort to gradually build a case from which the Chinese negotiators can form their own conclusions.
EVIDENCE ARRANGEMENTS

Combinations of evidence arranged into comparison structures may provide effective persuasive substantiation for particular claims. Crable (1974) suggested three methods for comparing data. They are: (1) residual reasoning methods, (2) criterial reasoning methods, and (3) comparative advantage methods.

Residual Reasoning

Residual reasoning is reserved for those times when all viable alternatives except one can be proven to be unworkable. For example, if during the planning stages of this negotiation, intelligence determines that: (1) China simply does not have the technology--nor the budget to import technology--needed to process HQS wheat in a way that will retain maximum nutritional content; or (2) China's modernization plans include a multi-bakery construction project already underway (which ignores wheat quality considerations); then U.S. negotiators are beginning to discover support for the claim "a HQS wheat offer is not likely to meet China's needs at this time." If sufficient evidence is accumulated that serves to prove that any offer containing some portion of HQS wheat is unworkable, then by way of residual reasoning, the U.S. negotiators may have substantiated the claim "the only wheat proposal that is likely to make sense in the context of this situation, is an offer of LQS wheat."

Criterial Reasoning

Criterial reasoning methods require that acceptable criteria are established first. Proposals are then designed to meet the
agreed-upon criteria. For example, U.S. and Chinese negotiators may agree that criteria necessary for a U.S./China future venture would include:

1. A capital investment commitment from both U.S. and China;
2. A final project requiring minimum high-tech maintenance;
3. Utilization of Chinese labor for construction and operation;
4. Minimized burden on China's already overloaded infrastructure;
5. Expansion of nutrition and diet-variety in China.

Once agreement on criteria is reached, U.S. negotiators can invent options that satisfy the established criteria. It may be easier to seek agreement on criteria before presenting any proposals.

Comparative Advantage Reasoning

Comparative advantage reasoning serves to compare both advantages and disadvantages of two or more alternatives. The following example serves to compare the number of potential advantages for two hypothetical wheat offers.

<table>
<thead>
<tr>
<th></th>
<th>Offer A</th>
<th>Offer B</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td>x</td>
</tr>
<tr>
<td>Nutritional content</td>
<td>x</td>
<td></td>
</tr>
</tbody>
</table>

While offer A may have more advantages than offer B, it may be difficult to assign viable weight to the factors. For example, from the Chinese point of view, the cost factor may completely outweigh all other considerations.
If this Appendix is treated as if it were an enthymeme, then under what conditions would each of the three methods be the best way to arrange the evidence?
APPENDIX D
RETROFLECTIVE EVALUATION STANDARDS
RETROFLECTIVE EVALUATION STANDARDS

Argumentation Standards

As noted in Appendix B, authors, Campbell (1982), Brockriede & Ehninger (1963), and Lucus (1983), agree that a competent argument contains a properly stated claim limited by qualification or reservation, and is supported by appropriate and sufficient evidence. Arguments can be structured in a variety of patterns ranging from: (1) a formal pattern, to (2) a less formal, enthymematic pattern (Campbell, 1982). Below is a checklist containing argumentation standards that may be useful for evaluating a given set of negotiation choices.

Argumentation Standards

Claim
Is the claim presented (stated or unstated) conditionally with appropriate qualification and reservation as likely to be perceived by the Chinese? _____

Evidence
Is the evidence selected to support that claim:
(1) Appropriate? _____
(2) Sufficient? _____

Structure
Which argument pattern is likely to be the more adaptive:
(1) Formal? _____
(2) Enthymematic? _____
Rhetorical Adaptation Standards

Negotiators can evaluate the adaptiveness of their strategic choices by using the following checklist.

**Rhetorical Adaptation Standards**

**Invention** (conceptualization):

Did negotiators discover sufficient and relevant negotiation information to answer questions about:

- Chinese demography?
- Chinese disposition toward:
  - Subject and purpose?
  - Speaker?
  - Situation in Context?

**Arrangement** (organization):

Did negotiators adapt the following arrangement choices to the potential Chinese point of view:

- Category selection (sets of related data)?
- Appropriate timing of information presentation?
- Structure for argument series and argument?
- Structure for evidence?

**Memory** (categorization):

Have necessary provisions been completed to insure that no information that is needed, when it is needed, is forgotten or overlooked?
Style (symbolization):

Did negotiators adapt verbal and nonverbal symbol-choices to what is known about the Chinese audience?

Delivery (operationalization):

Have negotiators adaptively operationalized the message(s) as likely to be perceived by the Chinese negotiators?

Intelligence Standards

As noted in Appendix A, the process of gathering intelligence information employs heuristic problem-solving techniques, whereby plausible inferences are induced from observable data. Polya (1948) suggested a sequence by which one can "intelligently" make plausible inferences within a given situation. Doing each of these steps in proper sequence provides a standard by which intelligence gathering efforts can be evaluated. While the following checklist represents a step-by-step process, it is intended to encourage the use of a feedback loop as needed along the way.

Intelligence Standards

Step 1 Have provisions been made to secure data from open sources?

Step 2 Has the structure of available data been mapped to show the correct inter-relationships?
Step 3  Has the structure (gap) of all kinds of relevant unknown data been determined? ______

Step 4  Can the gaps be filled by any one or combination of the following:

Substep a.  Open sources? ______

Substep b.  Making statistical inferences (Appendix A)? ______

Substep c.  Making plausible inferences (Appendix A)? ______

Win/Win Negotiation Standards

According to Nierenberg, "in a successful negotiation everybody wins" (1973, p. 20). Since it may be difficult to discern the degree of satisfaction experienced by either party at any stage of negotiation, it may be more helpful to attempt to assess the anticipated degree of dissatisfaction related to a particular negotiation strategy. Rather than attempting to determine whether a particular negotiation option is "fair" for both parties as perceived by an evaluator, a better way may be to attempt to judge the absence of discontent as may be experienced by either or both parties. For example, if two individuals are negotiating and one agrees to exchange with the other a mule for a mousetrap—and both parties are happy about the deal—then regardless of whether the agreement seems "fair" according to the perception of an observer, the negotiation can be said to be "successful" according to Nierenberg's orientation.

A way to structure win/win evaluation standards is by way of
priority standards. Each given negotiation option can be matched with the corresponding level of perceived mutual satisfaction. According to Nierenberg's orientation, the most desirable outcome is for neither party to be dissatisfied. The objective is to achieve agreement in which both parties win something, instead of "total victory" objectives sought by those who may view a negotiation as a game in which there is a winner and a loser.

Although controversial and potentially problematic, the next degree of desirability may be for both parties to (at least temporarily) lose in order to maintain a continuing relationship which holds the potential of future advantages for both sides. Nierenberg claims, "Unlike a game, there is no 'end' to a life negotiation situation" (1979, p. 23-24).

The least desirable category consistent with this orientation is a win/lose outcome. While winning a particular issue at the other's expense might seem immediately advantageous, the price to be paid by way of potential deterioration of an on-going relationship is rarely worth the advantage gained. Below is the win/win standard checklist.

Win/Win Standards

Should either negotiation party (or both) be dissatisfied with this particular set of communication strategies?

(1) (Win/Win) No. Neither party should be dissatisfied. ____

(2) (Lose/Lose) Yes. Both parties should be dissatisfied. ____

(3) (Win/Lose) Yes. Either the U.S. or the Chinese negotiators should be dissatisfied. ____
Below is a composite checklist which includes each component of the foregoing standards to be matched with the properties of each selected negotiation strategy to be evaluated.

**Key:**

A classification code was invented in order to identify the assessed status of each of the evaluated negotiation strategies. The coding system is as follows:

- ✓ the standard was met;
- ✓ the standard was partially met;
- x the standard was not met;
- ? some doubt at the time of assessment;

A blank space indicates that the particular standard was inapplicable.
While an awareness and application of selected standards may be useful to negotiators during every phase of "doing" negotiation, there may be times when it is inappropriate or undesirable for a negotiator to meet particular standards. For example, during early phases of preparation, when relevant information is being collected and arranged according to sets of related data, it may be unrealistic to expect that evidence for qualified claims pertaining to each set of data could be sufficient or fully appropriate at that time. On the other hand, by the time a negotiation strategy is communicated to the Chinese negotiators during a negotiation session, the sets of negotiation data (claims) upon which the communication strategy is based need to be carefully qualified and substantiated with sufficient and appropriate evidence. However, as illustrated in the set of wheat quality-related communication strategies, the strategies themselves may be designed to withhold explicit statement of claims or evidence in an effort to draw the Chinese negotiators into the inductive process of reaching their own conclusions.
Preface to the Partially Annotated Bibliography

The following pages contain a partially annotated list of selected references upon which this study was based. However, there is no mention of sources that have no enduring significance. For example, newspapers, periodicals, and U.S.D.A. government publications, from which a portion of Chapter II data was derived, do not appear in the list of references.

Instead of a comprehensive annotation, I have annotated only those sources that were apposite to the development of this methodology. Some annotations are brief and to the point, others offer a more detailed explanation of a particular concept and/or theory when appropriate.

In order for the reader to recognize groups of data according to a specific topic, I have classified the references. Each subunit is noted by a coded symbol.

Wherever reference is made within the text to a particular subgroup of literature, instead of listing each author separately, I have designated the appropriate code.

The reader can then refer to the alphabetized references, note the entries with symbols that correspond to the code in the text, and determine which resources are applicable.

In segments of the text where I refer to resources individually, I use the traditional A.P.A. reference notation system.

The following symbols represent these specific groups of data:

USCHRL ............... United States/China Relations
USCHNG ............... United States/China Negotiations
ICC ..................... Intercultural Communications
INTLNG ................ International Negotiations
SNS ..................... Social Negotiation Studies
CNS ..................... Contrasting Negotiation Styles
Partially Annotated Bibliography

These authors offered theoretical insight about validity issues in the context of social science research. The book describes a schema, called the Validity Network Schema, which serves "to lay out the research process in detail . . . and present the logical relations of different aspects of validity to different stages within that research process."

These authors systematically reviewed the contributions that English logician Stephen Toulmin made to the study of argumentation in *The Uses of Argument* (1958). Brockriede and Ehninger claim that Toulmin's analysis is important to the rhetorician for two different but related reasons. It provides: (1) an appropriate structural model by means
of which rhetorical arguments may be laid out for analysis and criticism; and (2) a system for classifying artistic proofs which employs argument as a central and unifying construct.

Buxbaum, et al., made the clear distinction between China trade "specialists" and "experts." They claim to be specialists (questioning whether "experts" exist) who have represented numerous American companies in Chinese trade contracts. The authors gave advice about how to both (1) use a trade specialist to the greatest advantage, and (2) enter the Chinese market independently. This source offered technical, procedural information about how to pursue a trade contract with the Chinese, as well as insight into the Chinese way of doing business.

This author chose a "practical application" approach to the study of rhetoric. Her book serves to highlight the
relationship between art and skill—the relationship between rhetorical theory and rhetorical practice.

Campbell defined rhetoric as "a strategy to encompass a situation" (Kenneth Burke) and as "that art . . . by which discourse is adapted to its end" (George Campbell). She explored the rhetorical obstacles inherent in the audience, subject/purpose, and rhetor, and then examined resources available to overcome these obstacles. The Rhetorical Act treats all forms of rhetoric as points on a continuum of influence. Rhetoric ranges from attempts to shape perceptions to ritualistic reaffirmations of "accepted truths" of the other. According to the author, the primary purpose of the book was "to train students to function as critics or analysts who assess a situation, conceive of rhetorical possibilities, examine actual rhetorical actions, and compare rhetorical acts" (p. v).

The author of this book focused on the use of communication in an "increasingly complex and organized world." Crable offered a comprehensive presentation designed to lead readers to: (1) understand the process of communication as a tool for solving problems; (2) diagnose communication problems or "conflicts"; (3) understand how communication "strategies" (concept-based skills) can be used for resolving or "mediating" communication conflict; and (4) use communication strategies for mediation. The methods that Crable suggested for organizing "reasoning strategies" provide guidelines for arranging argumentation evidence in the context of this study.

This book reflected the authors' investigation of the "traditional principles, processes, and skills involved in fitting together the separate lines of behavior of
individuals into mutually satisfying interpersonal relationships through the process of communication" (p. 1). The authors focused upon the role human interaction plays in establishing, maintaining, and terminating those intimate interpersonal relationships which provide individuals with their sense of personal worth and relational satisfaction.

Segments within this book may provide useful insight as negotiation team members seek to establish, maintain, and reassess their effective, working relationships in the context of a negotiation situation.

This source reflected an attempt to bring into focus some of the issues that must be resolved if "we, as persons, are to become more understanding of persons communicating." Darnell and Brockriede's ideas are based upon the concept that "people are choice makers." People choose to make choices on the basis of the best information and reasoning available in the context of various internal and external influences or restraints.

The focus of the book is on persons relating to other persons. The authors identified two "families" of interpersonal relationships. "One is characterized by rape or seduction, by monologue, or by action or interaction; the other is characterized by romance or love, by dialogue,
or by transaction" (p. 17). There are seven behavioral dimensions that distinguish the two families of interpersonal relationships; dimensions that represent degrees of freedom of choice human beings have within the constraints of physical and social environmental forces. Darnell and Brockriede's "two family, seven dimension" model of human communication was the basis from which the two contrasting negotiation approaches (choice-sharing vs. choice-restricting) utilized in the context of this methodology originated.

The authors offered a method of negotiating that departs from the traditional "soft" (making compromises, giving in, feeling exploited) and "hard" (using power by means of threats and/or intimidation) methods of negotiating. Their method, developed at the Harvard Negotiation Project, is one of "principled negotiation." This method reflects four "principle" considerations. They are: (1) separate the people from the problem; (2) focus on interests, not positions; (3) invent options for mutual gain; and (4) insist on using objective criteria. The overall orientation of this source is compatible with the orientation of my methodology.

The author, a former U.S. Government Trade Representative, developed a view of recent U.S./China trade relations. He explained the making of U.S. trade policies and some
of the apparent contradictions associated with implementation of those policies. For example, the U.S. administration cries out against the "appalling trade imbalance;" and at the same time, relaxes control over sales of high-technology articles to China while tightening the U.S. import restrictions on textiles.

According to Graham, specific issues include: (1) the Multi-Fibre Arrangement (MFA) Act under which the U.S. and other western nations restrict import textiles and apparel; (2) Generalized System of Preferences (GSP) whereby developing countries that "qualify" receive preferential tariff rates; (3) U.S./China Grain Trade Agreement; (4) liberalized policies related to U.S./China technology transfer; (5) the repeal of obsolete laws (enacted when U.S. and China were less friendly than now).

This book offered a systematic account of twenty-five centuries of study related to human communication theory dating from Aristotle to the present. According to Harper, "the basic assumptions of all these scholars has been
that communication is fundamental to every human activity. It is a primary thinking tool . . . socializing tool . . . and a process by which humans come to know, believe, and act." Periods of theoretical development include: (1) the classical period; (2) the medieval and renaissance period; and (3) the modern period.

Harper renamed Aristotle's five canons of rhetoric to reflect the development of understanding of human communication. Components of Harper's holistic paradigm are: (1) conceptualization (invention); (2) organization (arrangement); (3) symbolization (style); (4) categorization (memory); and (5) operationalization (delivery).

This historical perspective of rhetoric provided an effective analytical tool for developing the negotiation methodology.

An analysis of these parameters in national and international relations. *American Journal of Psychotherapy, 28*(2), 222-234.

Nierenberg, G. I.

Nierenberg introduced skills and strategies required to implement a "successful" negotiation—one in which everyone wins. This negotiation approach focuses on long-range objectives instead of short-term advantages.

Nierenberg's background in general semantics may have influenced him to consider unique sets of circumstances surrounding any given negotiation situation. His strategy recommendations reflect an assessment of needs, motivations, and assumptions of negotiators and their counterparts within each negotiation situation. His approach also reflects a systemic orientation: "the whole pattern of experience is more important than its individual parts in determining its meaning. . . . No matter what choice is made, everyone's strategy is dependent on everyone else's strategy" (1973, p. 45).
The following notations serve to highlight each of the three Nierenberg publications utilized in the context of this study.

This publication focused on the win/win negotiation approach in a business context. Examples of application include: purchasing and selling; real-estate negotiations; corporate negotiations; labor relations; and law.

This publication offered a comprehensive view of the fundamentals related to a win/win negotiation. Here, Nierenberg elaborated on the relationship between "negotiating" and "communicating." He developed the concept of "cooperative interaction" as it relates to the nature of people and their individual patterns of reasoning and behavior.

Nierenberg provided relevant advice concerning win/win negotiation preparation. For example, he noted: "Preparing for negotiation is a year-round function, as is negotiating" (p. 47). Preparation involves a careful process of accumulating relevant information making it plausible to "foresee the strategy of the opposite side and how you can best prepare to cope with it" (p. 47).

A skillful negotiator, according to Nierenberg, is ever alert to a circular chain of events: assumptions →
facts → issues → positions → decisions. If a negotiator wants to influence the other's decisions, s/he must first try to alter her/his assumptions. Nierenberg offered a system, grounded in general semantics, for analyzing and dealing with assumptions. He noted that "assumptions are a vital part of negotiations. In entering a negotiation, one is severely handicapped unless he reviews his own assumptions and anticipates the assumptions of the other party" (p. 70).

Another relevant concept that Nierenberg addressed is "creative-alternative" problem-solving which focuses on a mutual process of assessing integrated needs and discovering novel ways to satisfy those needs. This approach suggests that negotiators work together to brainstorm mutually advantageous (win/win) solutions. Nierenberg included a number of business-related examples in order to illustrate win/win negotiation strategies and tactics.

Nierenberg countered twenty-one rules for negotiating. For example:

This article serves to make a clear distinction between "win/win negotiation" and "negotiation by negation."

Negotiation by negation is characterized as one in which "appearance is everything; substance is nothing; one side wins everything, the other loses all."

Nierenberg countered twenty-one rules for negotiating. For example:
"Rule: Don't trust blind intuition.
Counter: Agreed, intuition is not a good tool, but developed intuition founded on wisdom and experience can discover the opposers real needs (inferential data . . . intuitive problem-solving)."

North is a political scientist whose research reflects a general systems approach. In this study he revealed the linkages and interdependencies of the information-processing and resource-processing functions of nations. Because of a systemic orientation, this article provided valuable insight into the interrelationships among nations.

College, Penn.: HRB-Singer.

This author provided a look at trends in information sciences and technologies relative to military intelligence. The information gathering system, grounded in heuristics, provides a model for gathering intelligence in a non-military context as well. The model provided useful insight, in the context of this methodology, as I sought to gather information relative to a wheat negotiation between the U.S. and China.

The intelligence gathering system is based upon knowledge of the methods and patterns of search and discovery in the context of human problem-solving. Heuristic methods represent a decreasing emphasis upon purely analytical methods, and an increasing emphasis on flexible methods involving the use of (1) inductive and inferential processes, (2) analogy, (3) isomorphic laws and relationships in diverse system types, (4) formulations of basic patterns in human problem-solving. Heuristic reasoning is not regarded as final, but provisional. Oneill notes that "modern heuristics aims at generality . . .: an examination of procedures which have application to wide ranges and types of problems."

**ICC**

**SNS**

Social scientists, Pruitt and Lewis, introduced two contrasting orientations and approaches to bargaining. The orientations are: (1) "more integrative," characterized by joint problem-solving behaviors whereby bargainers' goals are aimed toward satisfying both parties' needs; and (2) "less integrative," characterized by individualistic behaviors whereby bargainers' goals involve the exclusive satisfaction
of one's own individual needs.
The approach which leads toward a more integrative orientation
calls for (1) heuristic trial and error techniques, and
(2) information exchange techniques. The less integrative
approach calls for use of distributive techniques whereby
bargainers employ "threats, positional commitments, and
arguments to persuade each other to make concessions."
The contrasts set forth by Pruitt and Lewis provided some
background for the contrasting negotiation orientations
set forth in the context of this methodology.

of integrative bargaining. In D. Druckman (Ed.),
Negotiations: Social psychological perspectives.
Beverly Hills, Calif.: Sage.

Santa Monica: Rand Corporation.
This author analyzed the negotiation style of the Chinese
when doing business with Americans. The purpose of the
study, according to the author, was to "reduce future
misunderstandings in American commercial relations with
the Chinese and to provide guidelines for government-to-
government negotiations as well." This analysis of "Chinese
thought and attitude" in a negotiation context is an Asian
scholar's interpretation of an "extensive" series of interviews
with Americans who do business in China, plus a "leavening"
of Japanese' experiences.
The analysis included a look at (1) sources of potential
difficulties; (2) the ambience of negotiations; (3) prototypical
Chinese strategies; (4) the "substantive" negotiation
session; and (5) the emotional basis of the Chinese negotiating
style.

This study was completed for the Rand Corporation under
the research project: "China's strategic and Regional
Roles in Asian Security."

279-280.

This author reviewed business relations between "foreigners"
and the Chinese by introducing a "set of rules representing
a large and complex system which handles China's external
trading relations."

The analysis includes a look at: the basic Chinese commercial
structure with recent changes; the nature of the bureaucracy
that runs it (influencing factors); and "tactics and principles
of a successful negotiation approach" (p. 271).

The author of this study "assumes" that negotiators are
"well prepared when entering into negotiations, and possess
those qualities of patience, perseverance, tact and humour
which . . . are essential" (p. 271).

system-theoretic perspective. Quarterly Journal of
Speech, 64, 202-210.

Ruben, B. D., & Kim, J. H. (Eds.). (1975). General
Rummel examined the concept "intentional humanism" as it relates to dynamic conflict balance. According to Rummel, "Man intentionally directs his behaviors toward a future goal and can freely alter goals and associated behavior" (p. 179). "Directed behaviors" are based upon "truth." "Truth to the individual is perspectival; the outcome of a conflict between powers of reality and powers of man. . . . Social truths (knowledge of culture or society) are dependent on a clash of separate autonomous truths" (p. 179). For example, Rummel noted that "science is institutionalized conflict. . . . Scientific 'truths' represent a balance of powers among diverse views and evidence. . . . The conflict helix is directed at maximizing truth" (p. 184, See Rummel, 1977, for a brief explanation of the conflict helix.)

Rummel's view of social truth in relation to "man's" ability to direct his behavior is compatible with the rhetorical notion that "social truths, created and tested by people in groups, influence social and political decisions. . . .
From its beginnings, this emphasis on social truths has been the distinctive quality of the rhetorical perspective" (Campbell, 1982, p. 4).

Within this book the author chose to concentrate on the latent—hence more abstract—aspects of conflict theory. Rummel's theoretical framework is organized into three dominant social perspectives: (1) the psychological—exploration of man's nature and psychological processes; (2) socio-cultural—a situational view of man (characterizing conflict as an aspect of cooperation and differentiation); and (3) philosophical—a view of conflict which characterizes it as a continuous and natural clash of opposites. Rummel sought to demonstrate that the "conflict helix" underlies all conflict. He explained: "Latent meanings (values, norms, statuses, and classes) are the seat of social powers. Man strives to manifest these powers through others to gratify his interests and subordinate goals."

The field is alive. The process of conflict is a "dynamic swirl of manifest activity and latent potentialities and dispositions, but with order and direction" (p. 23). This theoretical view of conflict underlies the author's "primary concern, namely, collective conflict at the level of societies and states." He claimed to see societies
as a "complex balance of powers, each with different patterns of conflict diffusion." In addition, he presented examples of societies and related patterns of conflict. This study provided insight into the nature of conflict balance as it might relate to "managing conflict"—negotiating—in the context of a wheat negotiation between the U.S. and China.

The author of this study examined (1) the mechanics of U.S. and China trade negotiations; (2) how a company prepares for negotiations; (3) the factors that contribute to the success or failure of negotiations; and (4) the outcomes of such negotiations. Data pertaining to these characteristics were collected from 138 U.S. firms engaged in China trade.

These authors constructed a theoretical framework from which to view social interaction in a labor negotiation context. Their model provided two distinct negotiation "processes" which proved to be compatible with the contrasting negotiation styles introduced in this methodology. Walton and McKersie's distinctions are: (1) "distributive bargaining"—which refers to the activity of dividing limited resources... It occurs in situations in which one party wins what the other party loses" (zero-sum); and (2) "integrative bargaining"—which refers to "joint gain available (by way of) problem-solving activities which identify, enlarge, and act upon the common interests of the parties" (p. 11).

Walton and McKersie noted that "the implementing techniques (strategies) for these two processes generally stand in an antithetical relationship; however, the integrative and distributive processes are related and are sometimes difficult to separate in an actual contract negotiation" (p. 144).

University of Kansas.

This Chinese author outlined the procedural requirements in China for "procurement of merchandise to be imported." Steps include: preparations for negotiation prior to a transaction; "grasping" the international market situation; arranging shipment and delivery, negotiating the terms; signing the contract when agreement is reached; and implementing the contract accordingly.
